Gluon condensate and the Polyakov loop

Tuesday, 12 September 2017 18:35 (0:25)

Content

The temperature dependence of the gluon condensate is deduced from the Polyakov loop effective potential. It is shown that this approach provides a simple picture for the electric gluon condensate around the deconfinement temperature, showing that it drops to zero in a temperature range which is in good agreement with different pure gauge lattice results.

Session

Pertubative and nonperturbative QCD
