Measurement of photon (also +jets) production cross sections, jets production cross sections and extraction of the strong coupling constant

Monday, 11 September 2017 11:50 (0:25)

Content

The production of prompt isolated photons at hadron colliders provides a stringent test of perturbative QCD and can be used to probe the proton structure. The ATLAS collaboration has performed precise measurements of the inclusive production of isolated prompt photons at a centre-of-mass energy of 13 TeV, differential in both rapidity and the photon transverse momentum. In addition, the integrated and differential cross sections for isolated photon pairs and tri-photon production 8 TeV have been measured. The results are compared with state-of-the-art theory predictions at NLO in QCD and with predictions of several MC generators. The production of prompt photons in association with jets provides an additional testing ground for perturbative QCD (pQCD) with a hard colourless probe less affected by hadronisation effects than jet production. The ATLAS collaboration has studied the dynamics of isolated-photon production in association with gluon, light and heavy quark final states in pp collisions at a centre-of-mass energy of 8 and 13 TeV, which will be presented and discussed, as it constitutes an excellent probe of the flavour structure of the proton.

Session

Pertubative and nonperturbative QCD

Primary author(s): Dr. VILLAPLANA, Miguel (University of Milan)
Presenter(s): Dr. VILLAPLANA, Miguel (University of Milan)
Session Classification: Perturbative and nonperturbative features of QCD (I)
