## Hydrodynamical description of the QGP using energy-momentum in-medium deposition by an extended source

Monday, 11 September 2017 17:50 (0:05)

### Content

Fast-moving partons lose energy and momentum along their paths through the QGP. This deposition of energy-momentum creates a disturbance in the medium that can be described using approximations within relativistic hydrodynamics in a defined regime of the QGP evolution. Based on earlier research in this field, where a localized source was used to model the parton energy-momentum in-medium deposition and where the energy loss per unit length on the traveling-parton path is a simple function of its path length, we study the use of extended sources that depend on the location of the parton-jet in the initial stages of the QGP evolution. We explore this approach as a way to complement the current numerical landscape of hydrodynamical QGP studies and to eventually generate initial conditions that can be used as input on numerical simulations in different hydrodynamical set-ups.

### Session

Poster sessions

**Primary author(s) :** MALDONADO GONZÁLEZ, Julio César (Universidad de Sonora)

**Co-author(s) :** Dr. TEJEDA-YEOMANS, Maria Elena (Departamento de Fisica, Universidad de Sonora); Dr. DOMÍNGUEZ JIMÉNEZ, Isabel (Universidad Autónoma de Sinaloa); Dr. AYALA, Alejandro (Instituto de Ciencias Nucleares, UNAM)

**Presenter(s) :** MALDONADO GONZÁLEZ, Julio César (Universidad de Sonora)

**Session Classification :** Flash Talks
