# Outline

- We start replying the EPJC questions of the article.
- Visualizations were found at extreme values for selected primary particles (no secondaries):
  - $\text{So} < 0.02$ ,  $dN/d\eta > 40$ ,  $N_{ch} > 64$  ( $\eta = 1.6$ )
  - $\text{So} > 0.9$ ,  $dN/d\eta > 40$ ,  $N_{ch} > 64$  ( $\eta = 1.6$ )
- Jobs for MC and data are running to get the spectra for new spherocity bins
- Some requirements of Antonio to compare efficiency for different bins of multiplicity and and different spherocity selection.

const Int\_t nMultbins = 13;

Double\_t Multbins[nMultbins+1]={ 0.0, 1.0, 4.0, 7.0,

10.0, 15.0, 20.0, 25.0, 30.0, 40.0, 50.0, 60.0, 70.0, 140.0 };

const Int\_t nSobins = 4;

Double\_t Sobins[nSobins+1] = { 0.0, 0.2, 0.4, 0.7, 1.0 };

Some requirements of Antonio to compare efficiency for different bins of multiplicity and and different spherocity selection.

Questions to answer:

Wich has the best efficiency So or St?

What is the best? To cut directly with ES bins or to select percentages (10%) of the ES distribution)

## To Do:

- Commit the Task in AliRoot
- Get the full comparison with the efficiency.
- Get the spectra corrected by the efficiency for the new spherocity selection and multiplicity binning.
