## Tensor mesons in tau-decays

### Abstract content

We have computed the branching ratios for the  $\tau - T\pi\nu$  decays, where  $T$  is a  $3P_2$  tensor meson, using a meson dominance model. Specifically, we have worked with mesons  $T = K_2^*$  and  $a_2$ . Our results show that the fractions for these decays seem to be at the reach at B-factories which have accumulated largest samples of  $\tau^+$   $\tau^-$ .
