# What's the goal of this analysis?

To **estimate** the **admixtures** of the  $\eta$  and  $\eta'$  mesons to the physical  $\pi^0$

$$|\pi^0\rangle = |\pi_3\rangle + \epsilon |\eta\rangle + \epsilon' |\eta'\rangle$$

where  $\pi_3$  is the  **$I_3=0$  state** of the pseudoscalar **isospin triplet**

The responsible of this **mixing** is **isospin breaking**

T. Feldmann, P. Kroll and B. Stech, Phys. Lett. B449 (1999) 339

$$\epsilon = 1.4 \%$$

$$\epsilon' = 0.37 \%$$

# $\eta$ - $\eta'$ mixing: a reminder

## octet-singlet basis

$$\begin{aligned} |\eta\rangle &= \cos\theta_P |\eta_8\rangle - \sin\theta_P |\eta_0\rangle & |\eta_8\rangle &= \frac{1}{\sqrt{6}} |u\bar{u} + d\bar{d} - 2s\bar{s}\rangle \\ |\eta'\rangle &= \sin\theta_P |\eta_8\rangle + \cos\theta_P |\eta_0\rangle & |\eta_0\rangle &= \frac{1}{\sqrt{3}} |u\bar{u} + d\bar{d} + s\bar{s}\rangle \end{aligned}$$

## quark-flavour basis

$$\begin{aligned} |\eta\rangle &= \cos\phi_P |\eta_{\text{NS}}\rangle - \sin\phi_P |\eta_S\rangle & |\eta_{\text{NS}}\rangle &= \frac{1}{\sqrt{2}} |u\bar{u} + d\bar{d}\rangle \\ |\eta'\rangle &= \sin\phi_P |\eta_{\text{NS}}\rangle + \cos\phi_P |\eta_S\rangle & |\eta_S\rangle &= |s\bar{s}\rangle \end{aligned}$$

$$\boxed{\theta_P = \phi_P - \arctan \sqrt{2} \simeq \phi_P - 54.7^\circ}$$

$\eta$ - $\eta'$  is heavily influenced by the  $U(1)_A$  of QCD

# Conclusions

- The quality of the most up-to-date experimental data enables a small amount of isospin-symmetry breaking that is inconsistent with zero with a CL of approx. 2.5 sigmas
- The quality of the performed fits is good
- The estimations for the fit parameters appear to be robust
- Our estimates for

$$\epsilon_{12} = (2.4 \pm 1.0)\%$$

$$\epsilon_{13} = (2.5 \pm 0.9)\%$$

$$\epsilon = \epsilon_{\pi\eta} = (0.1 \pm 0.9)\%$$

$$\epsilon' = \epsilon_{\pi\eta'} = (3.5 \pm 0.9)\%$$

are not in accordance with theoretical estimates
