

Ghost dynamics from Schwinger-Dyson equations

Mauricio N. Ferreira

University of Campinas, Brazil.

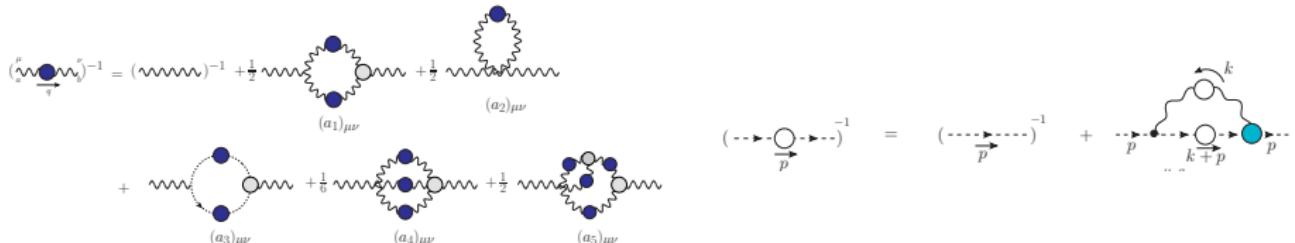

Hadron 2021
July 30th, 2021.

Based on:

A. C. Aguilar, C. O. Ambrósio, F. De Soto, M. N. F., B. M. Oliveira, J. Papavassiliou and J. Rodríguez-Quintero, arXiv:2107.00768.

Motivation

- Ghost sector Green's functions, in particular the ghost propagator and ghost-gluon vertex, appear as ingredients in several Schwinger-Dyson equations (SDEs), e.g. the gluon gap equation

- Studied using a variety of nonperturbative approaches, including Lattice QCD, SDEs, Functional Renormalization Group.

- ★ Ghost sector SDEs are the simplest: Clean environment for testing agreement with lattice and probe the effect of other Green's functions.

This work: Coupled dynamics of the ghost propagator and ghost-gluon vertex, consistency between SDE and lattice and impact of the three-gluon vertex.

Coupled SDEs

We solve the system of equations for the ghost propagator and the ghost-gluon vertex

$$\left(\cdots \xrightarrow{\quad} \textcircled{ } \xrightarrow{\quad} \cdots \right)^{-1} = \left(\cdots \xrightarrow{\quad p \quad} \cdots \right)^{-1} + \cdots \xrightarrow{\quad p \quad} \textcircled{ } \xrightarrow{\quad k+p \quad} \textcircled{ } \xrightarrow{\quad p \quad} \cdots$$

$$\begin{aligned} \mu, a & \downarrow q \\ \textcircled{ } & \xrightarrow{p} r \quad \bar{c}^m \\ c^n & \end{aligned} = \begin{aligned} \mu, a & \downarrow q \\ \textcircled{ } & \xrightarrow{p} r \quad \bar{c}^m \\ c^n & \end{aligned} + \begin{aligned} \mu, a & \downarrow q \\ \textcircled{ } & \xrightarrow{p} k+q \quad \textcircled{ } \xrightarrow{k} k-r \quad \bar{c}^m \\ c^n & \end{aligned} + \begin{aligned} \mu, a & \downarrow q \\ \textcircled{ } & \xrightarrow{p} k+q \quad \textcircled{ } \xrightarrow{k} k-r \quad \bar{c}^m \\ c^n & \end{aligned} + \begin{aligned} \mu, a & \downarrow q \\ \textcircled{ } & \xrightarrow{p} \quad \bar{c}^m \\ c^n & \end{aligned} \quad (d_1) \quad (d_2) \quad (d_3)$$

Coupled SDEs

We solve the system of equations for the ghost propagator and the ghost-gluon vertex

$$\left(\cdots \xrightarrow{p} \textcircled{ } \xrightarrow{p} \cdots \right)^{-1} = \left(\cdots \xrightarrow{p} \cdots \right)^{-1} + \cdots \xrightarrow{p} \textcircled{ } \xrightarrow{k+p} \textcircled{ } \xrightarrow{p} \cdots$$

The diagram shows a ghost-gluon vertex (a blue circle) with momentum p entering from the right and a ghost loop with momentum k entering from the left. The ghost loop has a self-energy insertion (a white circle with a dot) with momentum $k+p$. A gluon loop with momentum k is attached to the ghost loop.

$$\begin{array}{c} \mu, a \\ \textcircled{ } \xrightarrow{q} \end{array} = \begin{array}{c} \mu, a \\ \textcircled{ } \xrightarrow{q} \end{array} + \begin{array}{c} \mu, a \\ \textcircled{ } \xrightarrow{q} \end{array} + \begin{array}{c} \mu, a \\ \textcircled{ } \xrightarrow{q} \end{array} + \begin{array}{c} \mu, a \\ \textcircled{ } \xrightarrow{q} \end{array}$$

$$(d_1) \quad (d_2) \quad (d_3)$$

The equation shows the ghost-gluon vertex $\textcircled{ } \xrightarrow{q}$ equal to its bare part plus three loop corrections. The first correction (d_1) is a ghost loop with a gluon loop attached to it. The second correction (d_2) is a ghost loop with two gluon loops attached to it. The third correction (d_3) is a ghost loop with a ghost loop attached to it.

To close the system we need to provide

- Gluon propagator [all loop diagrams];

Coupled SDEs

We solve the system of equations for the ghost propagator and the ghost-gluon vertex

$$\left(\cdots \rightarrow \text{---} \circlearrowleft \rightarrow \cdots \right)^{-1} = \left(\cdots \xrightarrow{\quad p \quad} \cdots \right)^{-1} + \cdots \xrightarrow{\quad p \quad} \cdots \xrightarrow{\quad k+p \quad} \text{---} \xrightarrow{\quad p \quad}$$

$$\begin{aligned} \text{---} \xrightarrow{\quad p \quad} \text{---} \xrightarrow{\quad r \quad} &= \text{---} \xrightarrow{\quad p \quad} \text{---} \xrightarrow{\quad r \quad} + \text{---} \xrightarrow{\quad p \quad} \text{---} \xrightarrow{\quad k+q \quad} \text{---} \xrightarrow{\quad k \quad} \\ &\quad \text{---} \xrightarrow{\quad k-q \quad} \text{---} \xrightarrow{\quad k-r \quad} \text{---} \xrightarrow{\quad \bar{c}^m \quad} \quad (d_1) \\ &+ \text{---} \xrightarrow{\quad p \quad} \text{---} \xrightarrow{\quad k+q \quad} \text{---} \xrightarrow{\quad k \quad} \\ &\quad \text{---} \xrightarrow{\quad k-q \quad} \text{---} \xrightarrow{\quad k-r \quad} \text{---} \xrightarrow{\quad \bar{c}^m \quad} \quad (d_2) \\ &+ \text{---} \xrightarrow{\quad p \quad} \text{---} \xrightarrow{\quad k+q \quad} \text{---} \xrightarrow{\quad k \quad} \\ &\quad \text{---} \xrightarrow{\quad k-q \quad} \text{---} \xrightarrow{\quad k-r \quad} \text{---} \xrightarrow{\quad \bar{c}^m \quad} \quad (d_3) \end{aligned}$$

To close the system we need to provide

- Gluon propagator [all loop diagrams];
- **three-gluon vertex** [diagram (d_1)];

Coupled SDEs

We solve the system of equations for the ghost propagator and the ghost-gluon vertex

$$\left(\cdots \xrightarrow{p} \textcircled{ } \xrightarrow{p} \cdots \right)^{-1} = \left(\cdots \xrightarrow{p} \cdots \right)^{-1} + \cdots \xrightarrow{p} \textcircled{ } \xrightarrow{k+p} \textcircled{ } \xrightarrow{p} \cdots$$

$$\begin{aligned} \mu, a & \downarrow q \\ p & \nearrow r \quad \searrow \bar{c}^m \\ c^n & \end{aligned} = \begin{aligned} \mu, a & \downarrow q \\ p & \nearrow r \quad \searrow \bar{c}^m \\ c^n & \end{aligned} + \begin{aligned} \mu, a & \downarrow q \\ p & \nearrow r \quad \searrow \bar{c}^m \\ c^n & \end{aligned} + \begin{aligned} \mu, a & \downarrow q \\ p & \nearrow r \quad \searrow \bar{c}^m \\ c^n & \end{aligned} + \begin{aligned} \mu, a & \downarrow q \\ p & \nearrow r \quad \searrow \bar{c}^m \\ c^n & \end{aligned} \quad (d_1) \quad (d_2) \quad (d_3)$$

$\approx 2\%$

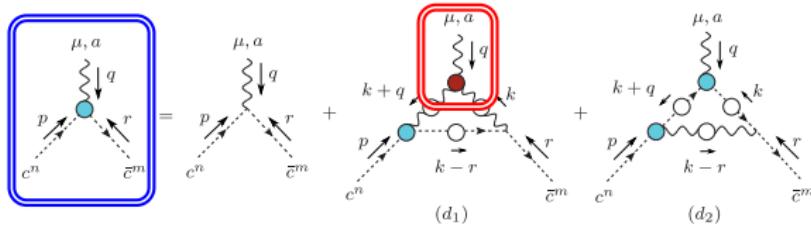

Huber, M. Q. Eur. Phys. J. C77, 733 (2017).

To close the system we need to provide

- Gluon propagator [all loop diagrams];
- **three-gluon vertex** [diagram (d_1)];
- **ghost-ghost-gluon-gluon vertex** [diagram (d_3)].

This we will omit \Rightarrow “one-loop dressed” truncation.

- Main remaining uncertainty is in the **three-gluon vertex**,

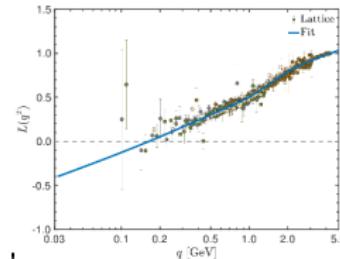

Sensitive to the three-gluon vertex.

- Because this SDE has little contamination of more higher order functions

Clean probe for the three-gluon vertex.

- In the soft gluon limit, the **three-gluon vertex** is **completely determined by the lattice**:

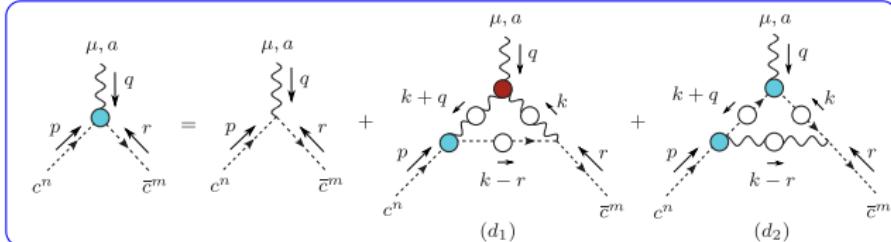

- Provides a nontrivial consistency check!

A. C. Aguilar, F. De Soto, M. N. F., J. Papavassiliou and J. Rodriguez-Quintero, Phys. Lett. B **818**, 136352 (2021).

Coupled SDEs: ghost-gluon vertex equation

Special properties of the ghost-gluon vertex simplify the analysis further:

- The most general structure of the ghost-gluon vertex is

$$\Gamma_\mu(r, p, q) = \boxed{B_1(r, p, q)} r_\mu + B_2(r, p, q) q_\mu .$$

- At tree level, $B_1^{(0)} = 1$ and $B_2^{(0)} = 0$.
- Now, in Landau gauge, by virtue of

$$\boxed{\Delta_{\mu\nu}(q) = -iP_{\mu\nu}(q)\Delta(q^2), \quad P_{\mu\nu}(q) = g_{\mu\nu} - q_\mu q_\nu / q^2 ,}$$

the form factor B_2 decouples from B_1 ,

$$B_1(r, p, q) = Z_1 + \int_\ell \mathcal{K}_1[B_1] + \int_\ell \mathcal{K}_2[B_1] .$$

- Also, in Landau gauge this vertex is **finite**: $Z_1 = 1$ (Taylor scheme).
 \Rightarrow Further simplifies analysis.

Taylor, J. C. Nucl. Phys. B33, 436–444 (1971).

Coupled SDEs: ghost propagator equation

We define the ghost dressing function, $F(p^2)$, as usual $D(p^2) = F(p^2)/p^2$. The SDE for the ghost propagator also simplifies in Landau gauge,

$$\left(\cdots \xrightarrow{\quad} \textcircled{O} \xrightarrow{\quad} \cdots \right)^{-1} = \left(\cdots \xrightarrow{\quad p \quad} \cdots \right)^{-1} + \text{Diagram} \quad \text{Diagram}$$

$$F^{-1}(p^2) = Z_c + \Sigma(p^2),$$

with

$$\Sigma(p^2) = ig^2 C_A Z_1 \int_k \left[1 - \frac{(k \cdot p)^2}{k^2 p^2} \right] B_1(-p, k+p, -k) \Delta(k) D(k+p).$$

- Only depends on the form factor B_1 (Landau gauge).
- Renormalization in the Taylor scheme, where $F(\mu^2) = 1$ and $Z_1 = 1$ entails,

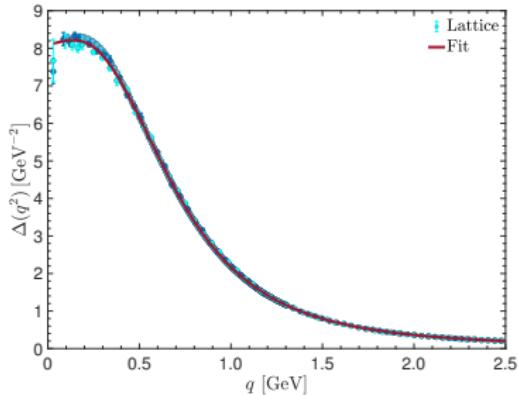

$$F^{-1}(p^2) = 1 + \Sigma(p^2) - \Sigma(\mu^2).$$

Inputs: gluon propagator

For the gluon propagator, we can use a fit to lattice data for $\Delta(q^2)$.

P. Boucaud, F. De Soto, K. Raya, J. Rodríguez-Quintero and S. Zafeiropoulos, Phys. Rev. D **98**, no.11, 114515 (2018).

I. L. Bogolubsky, E. M. Ilgenfritz , M. Muller-Preussker and A. Sternbeck, PoS **LATTICE2007**, 290 (2007).

- Most notable feature: IR saturation.
- Associated with the dynamical generation of a gluon mass scale.

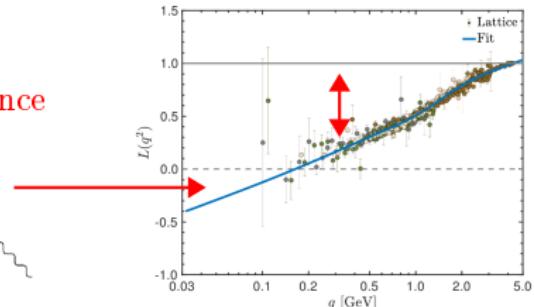

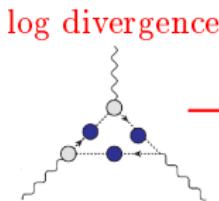

A. C. Aguilar and J. Papavassiliou, JHEP **12**, 012 (2006).

A. C. Aguilar, D. Binosi, C. T. Figueiredo and J. Papavassiliou, Phys. Rev. D **94**, no.4, 045002 (2016).

Inputs: Three-gluon vertex

The most complicated ingredient is the general kinematics **three-gluon vertex** appearing in the **ghost-gluon SDE**.

- Complicated tensor structure with 14 independent tensors.
- Each accompanied with a scalar form factor that is a function of three variables.
- Rich nonperturbative structure:
 - ◆ **IR suppression.**
 - ◆ **Zero-crossing**
 - ◆ IR divergences due to massless ghost loops.

A. C. Aguilar, F. De Soto, M. N. F., J. Papavassiliou and J. Rodríguez-Quintero, Phys. Lett. B **818**, 136352 (2021).

A. Athenodorou, D. Binosi, Ph. Boucaud, et al. Phys.Lett.B **761** (2016) 444-449.

A. C. Aguilar, D. Binosi, D. Ibañez and J. Papavassiliou, Phys. Rev. D **89**, no.8, 085008 (2014).

In this work we resort to the Gauge Technique construction for the **three-gluon vertex**.

A. C. Aguilar, M.N.F., C. T. Figueiredo and J. Papavassiliou, Phys.Rev.D **99** (2019) 3, 034026.

Gauge Technique three-gluon vertex

The three-gluon vertex satisfies a Slavnov-Taylor identity

$$q \cdot \Gamma^{\text{STI}} = F[\Delta^{-1}H - \Delta^{-1}H], \quad q \cdot \Gamma^{\text{Tr}} = 0, \quad \Gamma = \Gamma^{\text{STI}} + \Gamma^{\text{Tr}},$$

with H the ghost-gluon kernel [$q^\mu H_{\nu\mu}(q, p, r) = \Gamma_\mu(q, p, r)$].

A. C. Aguilar, M.N.F., C. T. Figueiredo and J. Papavassiliou, Phys.Rev.D 99 (2019) 9, 094010.

- The **transverse part** cannot be determined by the STI.
- ★ **But we can determine Γ^{STI} .**

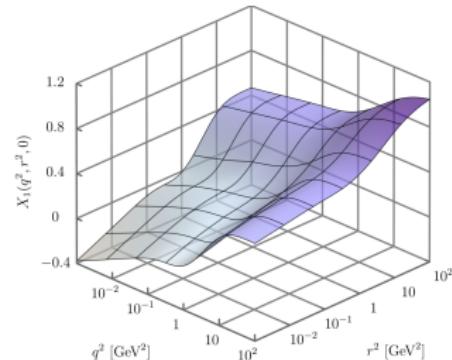

For simplicity, we retain only the “classical” tensor structure,

$$\Gamma_{\alpha\mu\nu}^{\text{STI}}(q, r, p) \approx (q - r)_\nu g_{\alpha\mu} X_1(q, r, p) + (r - p)_\alpha g_{\mu\nu} X_1(r, p, q) + (p - q)_\mu g_{\nu\alpha} X_1(p, q, r),$$

which reduces to the tree-level vertex with $X_1^{(0)} = 1$.

The form factor $X_1(q, r, p)$
captures the main features of the
three-gluon vertex:

- IR suppression;
- logarithmic IR divergences;
- perturbative anomalous dimension.

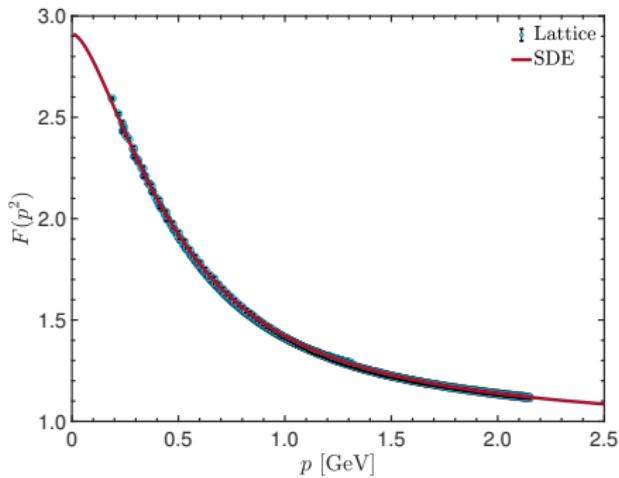

Results: Ghost dressing function

We first compare the resulting ghost dressing function to lattice data of
P. Boucaud, F. De Soto, K. Raya, J. Rodriguez-Quintero and S. Zafeiropoulos, Phys. Rev. D **98**,
no.11, 114515 (2018).

- Value of $\alpha_s = 0.244$ adjusted for best agreement.
- ★ Excellent agreement!
- ★ Careful treatment of the continuum limit of the lattice is key to this agreement.
- In previous works, with lattice not cured from discretization the agreement was not so perfect,
e.g.

A. C. Aguilar, M. N. F., C. T. Figueiredo and J. Papavassiliou, Phys. Rev. D **99**, no.3, 034026 (2019).

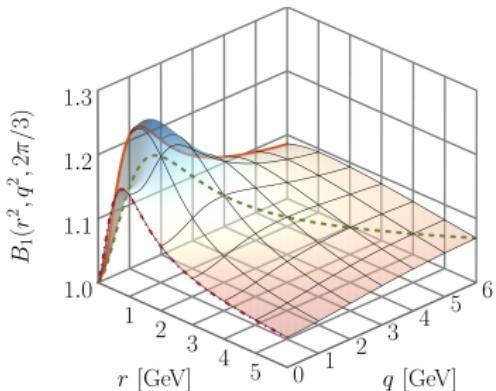

A. C. Aguilar, D. Ibáñez and J. Papavassiliou, Phys. Rev. D **87**, no.11, 114020 (2013)

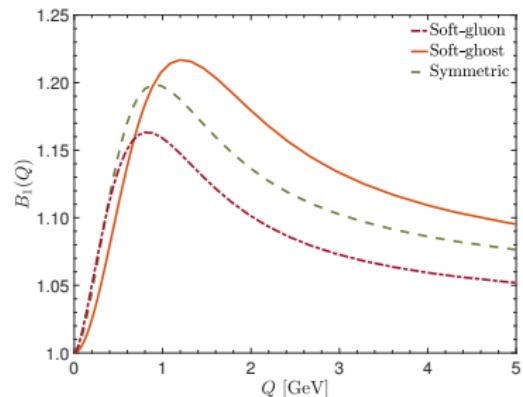

Results: ghost-gluon vertex

We can parametrize $B_1(r, p, q)$ in terms of the gluon and antighost momenta, q and r , respectively, and the angle θ between them.

A representative case: $\theta = 2\pi/3$

Some special limits:

- For all kinematics we find moderate deviations only from the tree level value, $B_1^{(0)} = 1$.
- Qualitative agreement with previous works.

 Barrios, N., Pelaez, M., Reinosa, U., et al. *Phys. Rev. D* **102**, 11401 (2020).

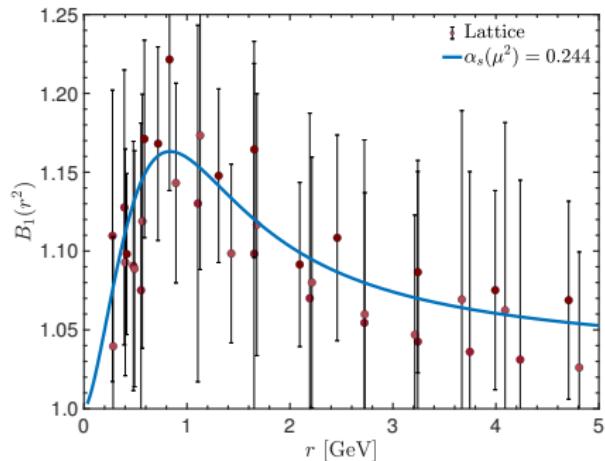

Results: ghost-gluon vertex

In the soft gluon limit there is lattice data available for the ghost-gluon vertex.

A. Sternbeck, (2006), arXiv:hep-lat/0609016 [hep-lat].

E.-M. Ilgenfritz, et al., Braz. J. Phys. 37, 193 (2007).

Again in agreement with the lattice:

Soft gluon limit: A nontrivial consistency check

In the soft gluon limit, $q = 0$, the **three-gluon vertex** contribution to the **ghost-gluon SDE** simplifies dramatically.

It can be shown that

$$P_\mu^{\mu'}(r) P_\nu^{\nu'}(-r) \Gamma_{\mu'\nu'\alpha}(r, -r, 0) = L(r^2) \lambda_{\mu'\nu'\alpha}(r), \quad \lambda_{\mu'\nu'\alpha}(r) := 2r_\alpha P_{\mu\nu}(r),$$

recalling that $P_{\mu\nu}(r) = g_{\mu\nu} - r_\mu r_\nu / r^2$ is the transverse projector.

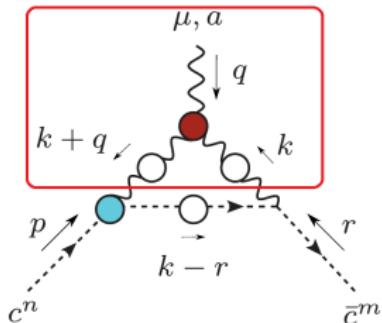

- Only one tensor structure.
- In the **ghost-gluon SDE**, for $q = 0$, the above is all we need:

Since in Landau gauge

$$\Delta_{\mu\nu}(q) = -i P_{\mu\nu}(q) \Delta(q^2),$$

the combination to the left becomes

$$-\Delta^2(k^2) L(k^2) \lambda_{\alpha\beta\mu}(k).$$

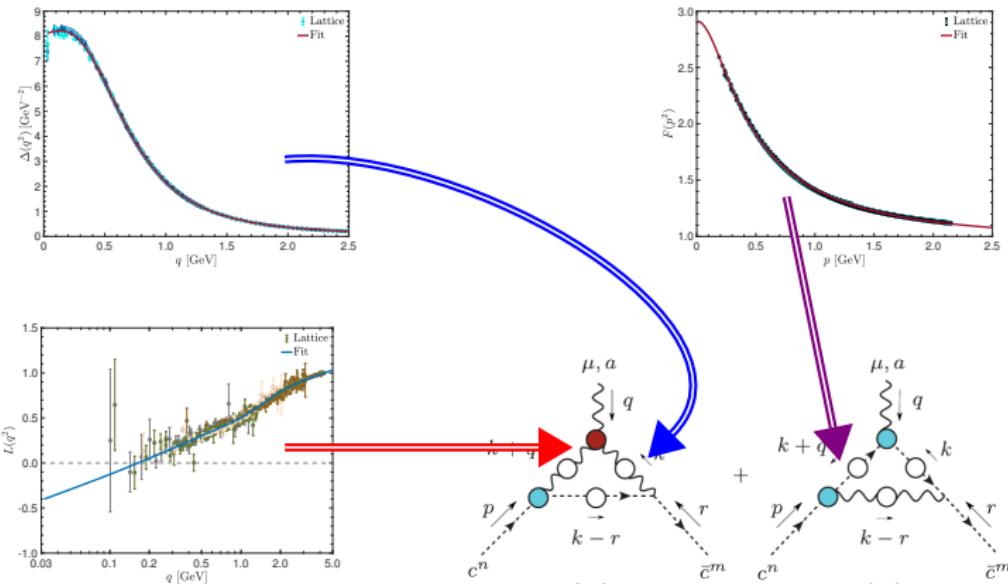

★ **Projection $L(q^2)$ accurately determined on the lattice.**

In this limit all external ingredients are known from lattice simulations:

A. C. Aguilar, F. De Soto, M. N. F., J. Papavassiliou and J. Rodríguez-Quintero, Phys. Lett. B **818**, 136352 (2021).

A. Athenodorou, D. Binosi, Ph. Boucaud, et al. Phys.Lett.B 761 (2016) 444-449.

P. Boucaud, F. De Soto, K. Raya, J. Rodríguez-Quintero and S. Zafeiropoulos, Phys. Rev. D **98**, no.11, 114515 (2018).

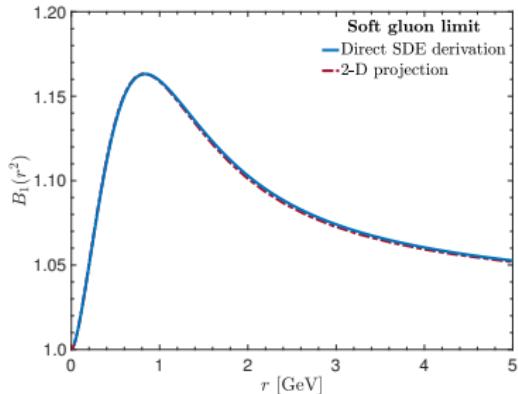

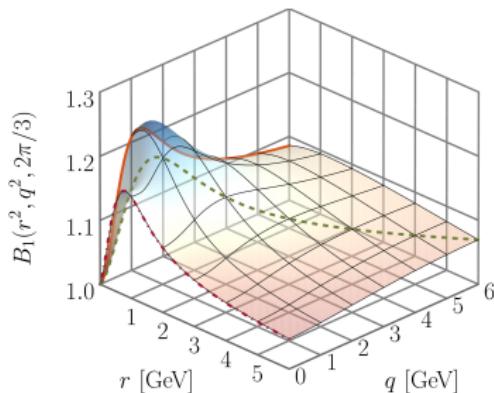

- All from the same lattice setups;
- and renormalized at the same point, $\mu = 4.3 \text{ GeV}$.

Comparison to general kinematics

Comparing the soft gluon limit of the coupled system with the result of the soft-gluon SDE with lattice inputs only provides a consistency check:

Soft gluon SDE:

Coupled system:

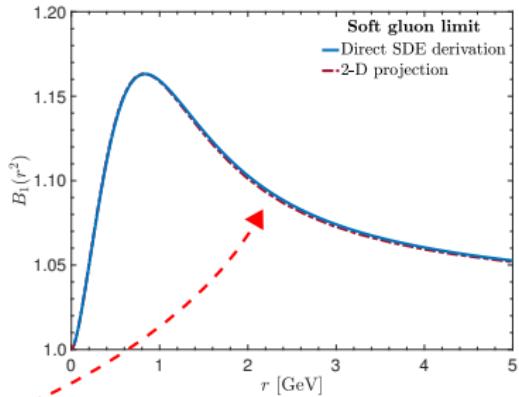

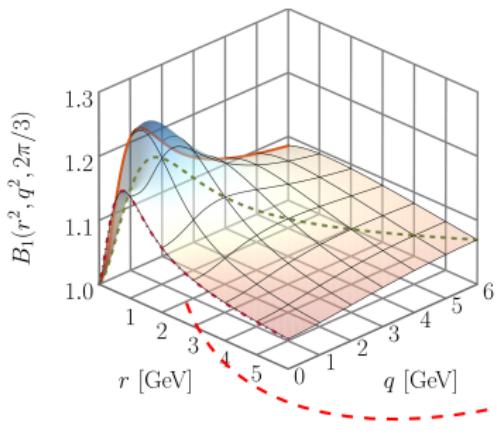

Comparison to general kinematics

Comparing the soft gluon limit of the coupled system with the result of the soft-gluon SDE with lattice inputs only provides a consistency check:

Soft gluon SDE:

Coupled system:

soft gluon slice

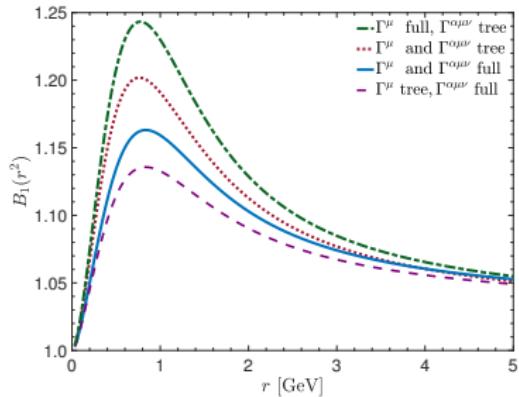

★ Results agree at the 2% level in quantum correction
 $(B_1 - 1)$.

Impact of the vertex dressings

We now consider the effect of the the vertex dressings in the result for B_1 .

Results exhibit the expected hierarchy:

- Significant suppression due to the three-gluon vertex;
- and enhancement due to the ghost-gluon vertex itself.
- Effects are most prominent around ~ 1 GeV.

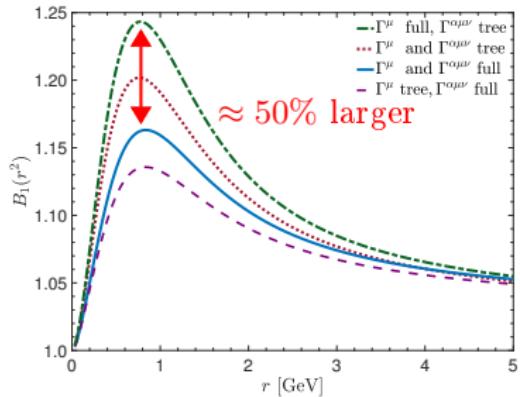

Impact of the vertex dressings

We now consider the effect of the the vertex dressings in the result for B_1 .

Results exhibit the expected hierarchy:

- Significant suppression due to the three-gluon vertex;
- and enhancement due to the ghost-gluon vertex itself.
- Effects are most prominent around ~ 1 GeV.

- ★ Most importantly, neglecting the three-gluon vertex yields 50% too big quantum correction for B_1 .

Conclusions

- We solved the coupled SDEs for the ghost propagator and general kinematics ghost-gluon vertex with most up-to-date lattice and gauge technique inputs.
- Results exhibit **excellent agreement with lattice** data, after careful treatment of discretization artifacts.
- In the soft gluon limit, a consistency check is possible using lattice inputs for all external ingredients.
 - ★ Consistency of **Lattice**, **SDE** and **Gauge Technique**.
- The characteristic **IR suppression of the three-gluon vertex** has an important quantitative effect on the ghost-gluon vertex.
