$$

[Talks by Myriam, Enrique, Antonio (yesterday)]

## Approaches towards solving the flavor puzzle

Traditional: discrete non-Abelian flavor symmetries $G_{\text {flavor }}$ lead to models for quarks and leptons with great fits, $\theta_{13} \neq 0, \ldots$ requiring careful choice of flavon sector and flavon vevs see reviews by Ishimori, Kobayashi, Ohki, Okada, Shimizu, Tanimoto (2010); Feruglio, Romanino (2019)
[Talks by Myriam, Enrique, Antonio (yesterday)]

Matter fields transform as $\quad \phi \rightarrow \underbrace{\rho_{\phi}(g)} \phi, \quad g \in G_{\text {flavor }}=S_{3}, A_{4}, \ldots$

## Approaches towards solving the flavor puzzle

Traditional: discrete non-Abelian flavor symmetries $G_{\text {flavor }}$ lead to models for quarks and leptons with great fits, $\theta_{13} \neq 0, \ldots$ requiring careful choice of flavon sector and flavon vevs
see reviews by Ishimori, Kobayashi, Ohki, Okada, Shimizu, Tanimoto (2010); Feruglio, Romanino (2019)
[Talks by Myriam, Enrique, Antonio (yesterday)]
flavon vev alignment is very challenging $;$

## Approaches towards solving the flavor puzzle

Traditional: discrete non-Abelian flavor symmetries $G_{\text {flavor }}$ lead to models for quarks and leptons with great fits, $\theta_{13} \neq 0, \ldots$ requiring careful choice of flavon sector and flavon vevs
see reviews by Ishimori, Kobayashi, Ohki, Okada, Shimizu, Tanimoto (2010); Feruglio, Romanino (2019)
[Talks by Myriam, Enrique, Antonio (yesterday)]
Modular: Yukawa couplings are modular forms $Y=Y(T)$
$Y(T) \rightarrow Y(\gamma T)=(c T+d)^{n_{Y}} \rho_{Y}(\gamma) Y(T), \quad \gamma \in \Gamma=\mathrm{SL}(2, \mathbb{Z}), \rho_{Y} \in \Gamma_{N}$

## Approaches towards solving the flavor puzzle

Traditional: discrete non-Abelian flavor symmetries $G_{\text {flavor }}$ lead to models for quarks and leptons with great fits, $\theta_{13} \neq 0, \ldots$ requiring careful choice of flavon sector and flavon vevs

Modular: Yukawa couplings are modular forms $Y=Y(T)$
$Y(T) \rightarrow Y(\gamma T)=(c T+d)^{n_{Y}} \rho_{Y}(\gamma) Y(T), \quad \gamma \in \Gamma=\mathrm{SL}(2, \mathbb{Z}), \rho_{Y} \in \Gamma_{N}$
Matter fields transform similarly: $\phi \rightarrow \underbrace{(c T+d)^{n_{\phi}}}_{\text {automorphy }} \rho_{\phi}(\gamma) \phi$

## Approaches towards solving the flavor puzzle

Traditional: discrete non-Abelian flavor symmetries $G_{\text {flavor }}$ lead to models for quarks and leptons with great fits, $\theta_{13} \neq 0, \ldots$ requiring careful choice of flavon sector and flavon vevs
see reviews by Ishimori, Kobayashi, Ohki, Okada, Shimizu, Tanimoto (2010); Feruglio, Romanino (2019)
[Talks by Myriam, Enrique, Antonio (yesterday)]
Modular: Yukawa couplings are modular forms $Y=Y(T)$
$Y(T) \rightarrow Y(\gamma T)=(c T+d)^{n_{Y}} \rho_{Y}(\gamma) Y(T), \quad \gamma \in \Gamma=\mathrm{SL}(2, \mathbb{Z}), \rho_{Y} \in \Gamma_{N}$
Matter fields transform similarly: $\phi \rightarrow(c T+d)^{n_{\phi}} \rho_{\phi}(\gamma) \phi$
$\Rightarrow$ finite modular groups $\Gamma_{N}=$ modular flavor symmetry $G_{\text {modular }}$

## Approaches towards solving the flavor puzzle

Traditional: discrete non-Abelian flavor symmetries $G_{\text {flavor }}$ lead to models for quarks and leptons with great fits, $\theta_{13} \neq 0, \ldots$ requiring careful choice of flavon sector and flavon vevs

- Siegel modular groups $\Gamma_{g, N} \cong \operatorname{Sp}(2 g, \mathbb{Z}) / K_{N}$ with multiple moduli
- $\Gamma / \operatorname{ker}(\varrho)$ with vector-valued modular forms

## Stringy ingredients

particles $\longleftrightarrow$ strings

- Supersymmetry (in fact, supergravedad - SUGRA) \& 10D space-time $\rightarrow$ compactify 6D on spaces with shapes and sizes set by moduli
- matter fields get all their properties from string features $\rightarrow$ all field charges are computable
- field couplings arise from string interactions $\rightarrow$ coupling strengths are computable modular forms

## Heterotic Orbifolds

Dixon, Harvey, Vafa, Witten (1985-86)
Ibáñez, Nilles, Quevedo (1987)
Font, Ibáñez, Quevedo, Sierra (1990)
Katsuki, Kawamura, Kobayashi, Ohtsubo, Ono, Tanioka (1990)
Kobayashi, Raby, Zhang (2004)
Buchmüller, Hamaguchi, Lebedev, Ratz (2004-06)
Kobayashi, Nilles, Plöger, Raby, Ratz (2006)
Lebedev, Nilles, Ratz, SRS, Vaudrevange, Wingerter (2006-08)

Mütter, Parr, Vaudrevange + Biermann, Ratz (2018-19)
Baur, Nilles, Trautner, Vaudrevange (2018-19)

## 1D $S^{1} / \mathbb{Z}_{2}$ orbifold

## 1D $S^{1} / \mathbb{Z}_{2}$ orbifold

In general, an orbifold $\mathcal{O}:=X / S$

## $2 \mathrm{D} \mathbb{T}^{2} / \mathbb{Z}_{N}$ orbifolds and $G_{\text {flavor }}$

- $\mathbb{T}^{2} / \mathbb{Z}_{3}$

triangular pillow $\rightarrow$ symmetry of a triangle $\left(S_{3} \rightarrow \Delta(27)\right)$

## $2 \mathrm{D} \mathbb{T}^{2} / \mathbb{Z}_{N}$ orbifolds and $G_{\text {flavor }}$

- $\mathbb{T}^{2} / \mathbb{Z}_{3}$

triangular pillow $\rightarrow$ symmetry of a triangle $\left(S_{3} \rightarrow \Delta(27)\right.$ )
- $\mathbb{T}^{2} / \mathbb{Z}_{2}$

tetrahedron $\rightarrow$ symmetry of a tetrahedron $\left(A_{4} \rightarrow\left(D_{8} \times D_{8}\right) / \mathbb{Z}_{2}\right)$

## In Abelian, toroidal heterotic orbifolds

- Orbifold $\mathcal{O}=\mathbb{R}^{6} / S \leftarrow$ space group: rotations, reflexions and shifts
- Localized states are subject to 2 kinds of symmetries

A: geometric symmetries $G_{\text {flavor }}$
B: stringy modular symmetries $\rightarrow \Gamma_{N}, \Gamma_{N}^{\prime}, \ldots$
(Technically, both arise as outer automorphisms of $S$ in Narain formalism)
Baur, Nilles, Trautner, Vaudrevange (1901.03251, 1908.00805)

## In Abelian, toroidal heterotic orbifolds

- Orbifold $\mathcal{O}=\mathbb{R}^{6} / S \leftarrow$ space group: rotations, reflexions and shifts
- Localized states are subject to 2 kinds of symmetries

A: geometric symmetries $G_{\text {flavor }}$
B: stringy modular symmetries $\rightarrow \Gamma_{N}, \Gamma_{N}^{\prime}, \ldots$
(Technically, both arise as outer automorphisms of $S$ in Narain formalism)
Baur, Nilles, Trautner, Vaudrevange (1901.03251, 1908.00805)
Strings offer a common origin for all possible flavor symmetries

## In Abelian, toroidal heterotic orbifolds

- Orbifold $\mathcal{O}=\mathbb{R}^{6} / S \leftarrow$ space group: rotations, reflexions and shifts
- Localized states are subject to 2 kinds of symmetries

A: geometric symmetries $G_{\text {flavor }}$
B: stringy modular symmetries $\rightarrow \Gamma_{N}, \Gamma_{N}^{\prime}, \ldots$
(Technically, both arise as outer automorphisms of $S$ in Narain formalism)
Baur, Nilles, Trautner, Vaudrevange (1901.03251, 1908.00805)
Strings offer a common origin for all possible flavor symmetries
A \& B combine to provide an eclectic picture of flavor
Nilles, SRS, Vaudrevange (2004.05200, 2006.03059, 2010.13798)

## In Abelian, toroidal heterotic orbifolds

- Orbifold $\mathcal{O}=\mathbb{R}^{6} / S \leftarrow$ space group: rotations, reflexions and shifts
- Localized states are subject to 2 kinds of symmetries

A: geometric symmetries $G_{\text {flavor }}$
B : stringy modular symmetries $\rightarrow \Gamma_{N}, \Gamma_{N}^{\prime}, \ldots$
(Technically, both arise as outer automorphisms of $S$ in Narain formalism)
Baur, Nilles, Trautner, Vaudrevange (1901.03251, 1908.00805)
Strings offer a common origin for all possible flavor symmetries
A \& B combine to provide an eclectic picture of flavor
Nilles, SRS, Vaudrevange (2004.05200, 2006.03059, 2010.13798)
Key eclectic obs: eclectic flavor $=A \rtimes B \quad$ and $\quad B \subset \operatorname{Out}(A)$
e.g. in $\mathbb{T}^{2} / \mathbb{Z}_{3}$, eclectic flavor $=\Delta(27) \rtimes T^{\prime} \quad$ and $T^{\prime} \subset \operatorname{Out}(\Delta(27))$

## In Abelian, toroidal heterotic orbifolds

- Orbifold $\mathcal{O}=\mathbb{R}^{6} / S \leftarrow$ space group: rotations, reflexions and shifts
- Localized states are subject to 2 kinds of symmetries

A: geometric symmetries $G_{\text {flavor }}$
B : stringy modular symmetries $\rightarrow \Gamma_{N}, \Gamma_{N}^{\prime}, \ldots$
(Technically, both arise as outer automorphisms of $S$ in Narain formalism)
Baur, Nilles, Trautner, Vaudrevange (1901.03251, 1908.00805)
Strings offer a common origin for all possible flavor symmetries
A \& B combine to provide an eclectic picture of flavor

Key eclectic obs: eclectic flavor $=A \rtimes B \quad$ and $\quad B \subset \operatorname{Out}(A)$
e.g. in $\mathbb{T}^{2} / \mathbb{Z}_{3}$, eclectic flavor $=\Delta(27) \rtimes T^{\prime} \quad$ and $T^{\prime} \subset \operatorname{Out}(\Delta(27))$

Advantage vs pure modular symmetries: kinetic terms (Kähler potential) under full control!

## MSSM with stringy flavor

## Flavor in

## semi-realistic orbifold models

## Explicit string model $\mathbb{T}^{6} / \mathbb{Z}_{3} \times \mathbb{Z}_{3}$

- Contains a sector $\mathbb{T}^{2} / \mathbb{Z}_{3}$

triangular pillow $\rightarrow$ traditional symmetry (moduli independent)

$$
\Delta(27) \cup\left\{\mathrm{S}^{2}\right\} \cong \Delta(54)
$$

## Explicit string model $\mathbb{T}^{6} / \mathbb{Z}_{3} \times \mathbb{Z}_{3}$

- Contains a sector $\mathbb{T}^{2} / \mathbb{Z}_{3}$
triangular pillow $\rightarrow$ traditional symmetry (moduli independent) $\Delta(27) \cup\left\{S^{2}\right\} \cong \Delta(54)$
- Toroidal modulus $T$ is free $\quad \rightarrow \quad \mathrm{SL}(2, \mathbb{Z})$ modular symmetry

## Explicit string model $\mathbb{T}^{6} / \mathbb{Z}_{3} \times \mathbb{Z}_{3}$

- Contains a sector $\mathbb{T}^{2} / \mathbb{Z}_{3}$

## Stringy Siegel Flavor Symmetries

# Siegel modular flavor group 

## from string theory

Baur, Kade, Nilles, SRS, Vaudrevange: 2008.07534, 2012.09586, 2104.03981

## Siegel modular symmetries from $\mathbb{T}^{2} / \mathbb{Z}_{2}$

- Recall that $\mathbb{T}^{2} / \mathbb{Z}_{2}$ yields $G_{\text {flavor }}=\left(D_{8} \times D_{8}\right) / \mathbb{Z}_{2}$

## Siegel modular symmetries from $\mathbb{T}^{2} / \mathbb{Z}_{2}$

- Recall that $\mathbb{T}^{2} / \mathbb{Z}_{2}$ yields $G_{\text {flavor }}=\left(D_{8} \times D_{8}\right) / \mathbb{Z}_{2}$
- BUT there are TWO free moduli $U, T \Rightarrow \mathrm{SL}(2, \mathbb{Z})_{U} \times \mathrm{SL}(2, \mathbb{Z})_{T}$ ?

## Siegel modular symmetries from $\mathbb{T}^{2} / \mathbb{Z}_{2}$

- Recall that $\mathbb{T}^{2} / \mathbb{Z}_{2}$ yields $G_{\text {flavor }}=\left(D_{8} \times D_{8}\right) / \mathbb{Z}_{2}$
- BUT there are TWO free moduli $U, T \Rightarrow \mathrm{SL}(2, \mathbb{Z})_{U} \times \operatorname{SL}(2, \mathbb{Z})_{T}$ ? NO!

## Siegel modular symmetries from $\mathbb{T}^{2} / \mathbb{Z}_{2}$

- Recall that $\mathbb{T}^{2} / \mathbb{Z}_{2}$ yields $G_{\text {flavor }}=\left(D_{8} \times D_{8}\right) / \mathbb{Z}_{2}$
- BUT there are TWO free moduli $U, T \Rightarrow \mathrm{SL}(2, \mathbb{Z})_{U} \times \operatorname{SL}(2, \mathbb{Z})_{T}$ ? NO!
- The resulting modular symmetry is

$$
\mathrm{Sp}(4, \mathbb{Z}) \supset \mathrm{SL}(2, \mathbb{Z})_{U} \times \mathrm{SL}(2, \mathbb{Z})_{T}
$$

## Siegel modular symmetries from $\mathbb{T}^{2} / \mathbb{Z}_{2}$

- Recall that $\mathbb{T}^{2} / \mathbb{Z}_{2}$ yields $G_{\text {flavor }}=\left(D_{8} \times D_{8}\right) / \mathbb{Z}_{2}$
- BUT there are TWO free moduli $U, T \Rightarrow \mathrm{SL}(2, \mathbb{Z})_{U} \times \mathrm{SL}(2, \mathbb{Z})_{T}$ ? NO!
- The resulting modular symmetry is

$$
\mathrm{Sp}(4, \mathbb{Z}) \supset \mathrm{SL}(2, \mathbb{Z})_{U} \times \mathrm{SL}(2, \mathbb{Z})_{T}
$$

Linearly realized as $G_{\text {modular }}=\left(S_{3}^{T} \times S_{3}^{U}\right) \rtimes \mathbb{Z}_{4}^{M}$

## Siegel modular symmetries from $\mathbb{T}^{2} / \mathbb{Z}_{2}$

- Recall that $\mathbb{T}^{2} / \mathbb{Z}_{2}$ yields $G_{\text {flavor }}=\left(D_{8} \times D_{8}\right) / \mathbb{Z}_{2}$
- BUT there are TWO free moduli $U, T \Rightarrow \mathrm{SL}(2, \mathbb{Z})_{U} \times \mathrm{SL}(2, \mathbb{Z})_{T}$ ? NO!
- The resulting modular symmetry is

$$
\mathrm{Sp}(4, \mathbb{Z}) \supset \mathrm{SL}(2, \mathbb{Z})_{U} \times \mathrm{SL}(2, \mathbb{Z})_{T}
$$

Linearly realized as $G_{\text {modular }}=\left(S_{3}^{T} \times S_{3}^{U}\right) \rtimes \mathbb{Z}_{4}^{M}$

- Eclectic structure: $G_{\text {eclectic }}=G_{\text {flavor }} \rtimes G_{\text {modular }}$, order $=4608$

## Siegel modular symmetries from $\mathbb{T}^{2} / \mathbb{Z}_{2}$

- Recall that $\mathbb{T}^{2} / \mathbb{Z}_{2}$ yields $G_{\text {flavor }}=\left(D_{8} \times D_{8}\right) / \mathbb{Z}_{2}$
- BUT there are TWO free moduli $U, T \Rightarrow \mathrm{SL}(2, \mathbb{Z})_{U} \times \mathrm{SL}(2, \mathbb{Z})_{T}$ ? NO!
- The resulting modular symmetry is

$$
\mathrm{Sp}(4, \mathbb{Z}) \supset \mathrm{SL}(2, \mathbb{Z})_{U} \times \mathrm{SL}(2, \mathbb{Z})_{T}
$$

Linearly realized as $G_{\text {modular }}=\left(S_{3}^{T} \times S_{3}^{U}\right) \rtimes \mathbb{Z}_{4}^{M}$

- Eclectic structure: $G_{\text {eclectic }}=G_{\text {flavor }} \rtimes G_{\text {modular }}$, order $=4608$
bottom-up and top-down phenomenology unexplored !!

## Quasi-eclectic symmetries for model building

## Quasi-Eclectic realization <br> of a simple lepton model

## Quasi-eclectic picture $A_{4} \times \Gamma_{3} \rightarrow A_{4}$

Chen, Knapp-Pérez, Ramos-Hamud, SRS, Ratz, Shukla (2021)

|  | $\left(E_{1}^{\mathcal{C}}, E_{2}^{\mathcal{C}}, E_{3}^{\mathcal{C}}\right)$ | $L$ | $H_{d}$ | $H_{u}$ | $\chi$ | $\varphi$ | $S_{\chi}$ | $S_{\varphi}$ | $Y$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $A_{4}^{\text {traditional }}$ | $\left(\mathbf{1}_{0}, \mathbf{1}_{\mathbf{2}}, \mathbf{1}_{\mathbf{1}}\right)$ | $\mathbf{3}$ | $\mathbf{1}_{0}$ | $\mathbf{1}_{0}$ | $\mathbf{3}$ | $\mathbf{3}$ | $\mathbf{1}_{0}$ | $\mathbf{1}_{0}$ | $\mathbf{1}_{0}$ |
| $\Gamma_{3}$ | $\mathbf{1}_{0}$ | $\mathbf{1}_{0}$ | $\mathbf{1}_{0}$ | $\mathbf{1}_{0}$ | $\mathbf{3}$ | $\mathbf{1}_{0}$ | $\mathbf{1}_{0}$ | $\mathbf{1}_{0}$ | $\mathbf{3}$ |
| modular weights | $(1,1,1)$ | -1 | 0 | 0 | 0 | 0 | 0 | 0 | 2 |

Alternative to eclectic: quasi-eclectic picture $G_{\text {modular }} \times G_{\text {flavor }}$

## Quasi-eclectic picture $A_{4} \times \Gamma_{3} \rightarrow A_{4}$

Chen, Knapp-Pérez, Ramos-Hamud, SRS, Ratz, Shukla (2021)

|  | $\left(E_{1}^{\mathcal{C}}, E_{2}^{\mathcal{C}}, E_{3}^{\mathcal{C}}\right)$ | $L$ | $H_{d}$ | $H_{u}$ | $\chi$ | $\varphi$ | $S_{\chi}$ | $S_{\varphi}$ | $Y$ |

| $A_{4}^{\text {traditional }}$ | $\left(\mathbf{1}_{0}, \mathbf{1}_{\mathbf{2}}, \mathbf{1}_{\mathbf{1}}\right)$ | $\mathbf{3}$ | $\mathbf{1}_{0}$ | $\mathbf{1}_{0}$ | $\mathbf{3}$ | $\mathbf{3}$ | $\mathbf{1}_{0}$ | $\mathbf{1}_{0}$ | $\mathbf{1}_{0}$ |
| $\Gamma_{3}$ | $\mathbf{1}_{0}$ | $\mathbf{1}_{0}$ | $\mathbf{1}_{0}$ | $\mathbf{1}_{0}$ | $\mathbf{3}$ | $\mathbf{1}_{0}$ | $\mathbf{1}_{0}$ | $\mathbf{1}_{0}$ | $\mathbf{3}$ |
| modular weights | $(1,1,1)$ | -1 | 0 | 0 | 0 | 0 | 0 | 0 | 2 |

Alternative to eclectic: quasi-eclectic picture $G_{\text {modular }} \times G_{\text {flavor }}$ Inherits control over the Kähler potential because of $G_{\text {flavor }}$

## Quasi-eclectic picture $A_{4} \times \Gamma_{3} \rightarrow A_{4}$

Chen, Knapp-Pérez, Ramos-Hamud, SRS, Ratz, Shukla (2021)

|  | $\left(E_{1}^{\mathcal{C}}, E_{2}^{\mathcal{C}}, E_{3}^{\mathcal{C}}\right)$ | $L$ | $H_{d}$ | $H_{u}$ | $\chi$ | $\varphi$ | $S_{\chi}$ | $S_{\varphi}$ | $Y$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $A_{4}^{\text {traditional }}$ | $\left(\mathbf{1}_{0}, \mathbf{1}_{\mathbf{2}}, \mathbf{1}_{\mathbf{1}}\right)$ | $\mathbf{3}$ | $\mathbf{1}_{0}$ | $\mathbf{1}_{0}$ | $\mathbf{3}$ | $\mathbf{3}$ | $\mathbf{1}_{0}$ | $\mathbf{1}_{0}$ | $\mathbf{1}_{0}$ |
| $\Gamma_{3}$ | $\mathbf{1}_{0}$ | $\mathbf{1}_{0}$ | $\mathbf{1}_{0}$ | $\mathbf{1}_{0}$ | $\mathbf{3}$ | $\mathbf{1}_{0}$ | $\mathbf{1}_{0}$ | $\mathbf{1}_{0}$ | $\mathbf{3}$ |
| modular weights | $(1,1,1)$ | -1 | 0 | 0 | 0 | 0 | 0 | 0 | 2 |

Alternative to eclectic: quasi-eclectic picture $G_{\text {modular }} \times G_{\text {flavor }}$ Inherits control over the Kähler potential because of $G_{\text {flavor }}$ Choose flavon $\chi:(\mathbf{3}, \mathbf{3})$ and a diagonal VEV $\langle\chi\rangle=v_{1} \operatorname{diag}\{1,1,1\}$

## Quasi-eclectic picture $A_{4} \times \Gamma_{3} \rightarrow A_{4}$

Chen, Knapp-Pérez, Ramos-Hamud, SRS, Ratz, Shukla (2021)

|  | $\left(E_{1}^{\mathcal{C}}, E_{2}^{\mathcal{C}}, E_{3}^{\mathcal{C}}\right)$ | $L$ | $H_{d}$ | $H_{u}$ | $\chi$ | $\varphi$ | $S_{\chi}$ | $S_{\varphi}$ | $Y$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $A_{4}^{\text {traditional }}$ | $\left(\mathbf{1}_{0}, \mathbf{1}_{\mathbf{2}}, \mathbf{1}_{\mathbf{1}}\right)$ | $\mathbf{3}$ | $\mathbf{1}_{0}$ | $\mathbf{1}_{0}$ | $\mathbf{3}$ | $\mathbf{3}$ | $\mathbf{1}_{0}$ | $\mathbf{1}_{0}$ | $\mathbf{1}_{0}$ |
| $\Gamma_{3}$ | $\mathbf{1}_{0}$ | $\mathbf{1}_{0}$ | $\mathbf{1}_{0}$ | $\mathbf{1}_{0}$ | $\mathbf{3}$ | $\mathbf{1}_{0}$ | $\mathbf{1}_{0}$ | $\mathbf{1}_{0}$ | $\mathbf{3}$ |
| modular weights | $(1,1,1)$ | -1 | 0 | 0 | 0 | 0 | 0 | 0 | 2 |

Alternative to eclectic: quasi-eclectic picture $G_{\text {modular }} \times G_{\text {flavor }}$ Inherits control over the Kähler potential because of $G_{\text {flavor }}$
Choose flavon $\chi:(\mathbf{3}, \mathbf{3})$ and a diagonal VEV $\langle\chi\rangle=v_{1} \operatorname{diag}\{1,1,1\}$
canonical

$m_{\nu}=\frac{v_{u}^{2} \varepsilon_{1}}{\sqrt{3} \Lambda}\left(\begin{array}{ccc}2 Y_{1}(\tau) & -Y_{3}(\tau) & -Y_{2}(\tau) \\ -Y_{3}(\tau) & 2 Y_{2}(\tau) & -Y_{1}(\tau) \\ -Y_{2}(\tau) & -Y_{1}(\tau) & 2 Y_{3}(\tau)\end{array}\right)$
phenomenology like Feruglio's first model canonical kinetic terms

## Concluding remarks

## In summary

## Concluding remarks

- Flavor puzzle: open questions about flavor (number and mixings of particles)

## Concluding remarks

- Flavor puzzle: open questions about flavor (number and mixings of particles)
- String theory: candidate theory for quantum gravity and all other quantum interactions

## Concluding remarks

- Flavor puzzle: open questions about flavor (number and mixings of particles)
- String theory: candidate theory for quantum gravity and all other quantum interactions
- Toroidal orbifold compactifications of string theory reveal an eclectic flavor structure $=$ non-modular $\rtimes$ modular symmetries

## Concluding remarks

- Flavor puzzle: open questions about flavor (number and mixings of particles)
- String theory: candidate theory for quantum gravity and all other quantum interactions
- Toroidal orbifold compactifications of string theory reveal an eclectic flavor structure $=$ non-modular $\rtimes$ modular symmetries
- Symmetries, representations and charges fixed by the compactification

## Concluding remarks

- Flavor puzzle: open questions about flavor (number and mixings of particles)
- String theory: candidate theory for quantum gravity and all other quantum interactions
- Toroidal orbifold compactifications of string theory reveal an eclectic flavor structure $=$ non-modular $\rtimes$ modular symmetries
- Symmetries, representations and charges fixed by the compactification
- Many string models that reproduce features of SM

Olguín-Trejo, Pérez-Martínez, SRS (1808.06622)

## Concluding remarks

- Flavor puzzle: open questions about flavor (number and mixings of particles)
- String theory: candidate theory for quantum gravity and all other quantum interactions
- Toroidal orbifold compactifications of string theory reveal an eclectic flavor structure $=$ non-modular $\rtimes$ modular symmetries
- Symmetries, representations and charges fixed by the compactification
- Many string models that reproduce features of SM

Olguín-Trejo, Pérez-Martínez, SRS (1808.06622)

- Consequences for flavor in explicit constructions are studied

## Concluding remarks

- Flavor puzzle: open questions about flavor (number and mixings of particles)
- String theory: candidate theory for quantum gravity and all other quantum interactions
- Toroidal orbifold compactifications of string theory reveal an eclectic flavor structure $=$ non-modular $\rtimes$ modular symmetries
- Symmetries, representations and charges fixed by the compactification
- Many string models that reproduce features of $\begin{gathered}\text { olgunn-Trejo, P }\end{gathered}$

Olguín-Trejo, Pérez-Martínez, SRS (1808.06622)

- Consequences for flavor in explicit constructions are studied
- (Solve many challenges of existing particle physics models with flavor symmetries!)

## Concluding remarks

- Flavor puzzle: open questions about flavor (number and mixings of particles)
- String theory: candidate theory for quantum gravity and all other quantum interactions
- Toroidal orbifold compactifications of string theory reveal an eclectic flavor structure $=$ non-modular $\rtimes$ modular symmetries
- Symmetries, representations and charges fixed by the compactification
- Many string models that reproduce features of $\begin{gathered}\text { olgunn-Trejo, P }\end{gathered}$

Olguín-Trejo, Pérez-Martínez, SRS (1808.06622)

- Consequences for flavor in explicit constructions are studied
- (Solve many challenges of existing particle physics models with flavor symmetries!)
- Interesting predictions on neutrino physics

Caveat: some free parameters, less than the number of predictions

## Concluding remarks

- Flavor puzzle: open questions about flavor (number and mixings of particles)
- String theory: candidate theory for quantum gravity and all other quantum interactions
- Toroidal orbifold comnartifiratinne of ctrino thennv raveal an eclectic flavor To work on
- flavor with $\mathbb{T}^{2} / \mathbb{Z}_{4} \& \mathbb{T}^{2} / \mathbb{Z}_{6}$ ?
- $\mathcal{C P}$ and $\mathcal{C P}$ violation ?
- Symmetries, represe
- Many string models
- Consequences for fla
- (Solve many challen symmetries!)
- Interesting predictio

Nilles, Ratz, Trautner, Vaudrevange (2018)

- bottom-up pheno with $\Gamma_{N}, N>6$ ?

Arriaga, SRS,... (2023)
or

- dynamic moduli stabilization \& de Sitter ?

Knapp, Liu, Nilles, SRS, Ratz (2023)

- more pheno in these models ?
- non-supersymmetric constructions ?

Pérez-Martínez, SRS, Vaudrevange (2105.03460)

- already testable predictions ?

## Concluding remarks

- Flavor puzzle: open questions about flavor (number and mixings of particles)
- String theory: candidate theory for quantum gravity and all other quantum interactions
- Toroidal orbifold compactifications of string theory reveal an eclectic flavor structure $=$ non-modular $\rtimes$ modular symmetries
- Symmetries, representations and charges fixed by the compactification
- Many string models And beyond...
- Consequences for fla
- (Solve many challen symmetries!)
- Interesting predictio Caveat: some free $p$
- DM + inflation with KK ALPs?

Gordillo, Morales, SRS (2023)

- DM in multi-Higgs non-SUSY models ?

Cervantes, Pérez-Figueroa, Pérez-Martínez, SRS (2302.08520)

- Spectral distortions in inflation?

Baur, Henríquez, García, SRS (2023)

- non-Abelian orbifolds \& flavor?

Hernández-Segura, SRS (2023)

- Machine learning for better models?

## Modular symmetries as flavor symmetries

Congruence modular subgroups: $\Gamma(N) \subset \mathrm{SL}(2, \mathbb{Z})$

$$
\Gamma(N)=\{\gamma \in \operatorname{SL}(2, \mathbb{Z}) \mid \gamma=\mathbb{1} \quad \bmod N\}
$$

are normal subgroups of $\mathrm{SL}(2, \mathbb{Z})$

## Modular symmetries as flavor symmetries

Congruence modular subgroups: $\Gamma(N) \subset \mathrm{SL}(2, \mathbb{Z})$

$$
\Gamma(N)=\{\gamma \in \operatorname{SL}(2, \mathbb{Z}) \mid \gamma=\mathbb{1} \quad \bmod N\}
$$

are normal subgroups of $\mathrm{SL}(2, \mathbb{Z})$
(Double-cover) finite modular subgroups: $\Gamma_{N}^{\prime} \cong \mathrm{SL}(2, \mathbb{Z}) / \Gamma(N)$

$$
\Gamma_{N}^{\prime}=\left\langle\mathrm{S}, \mathrm{~T} \mid \mathrm{S}^{4}=(\mathrm{ST})^{3}=T^{N}=\mathbb{1}, \quad \mathrm{S}^{2} \mathrm{~T}=\mathrm{TS}^{2}, \quad N=2,3,4,5\right\rangle
$$

$$
\Gamma_{2}^{\prime} \cong S_{3}, \Gamma_{3}^{\prime} \cong T^{\prime}, \Gamma_{4} \cong \mathrm{SL}(2,4), \Gamma_{5} \cong \mathrm{SL}(2,5), \ldots
$$

## Modular symmetries as flavor symmetries

Congruence modular subgroups: $\Gamma(N) \subset \mathrm{SL}(2, \mathbb{Z})$

$$
\Gamma(N)=\{\gamma \in \operatorname{sL}(2, \mathbb{Z}) \mid \gamma=\mathbb{1} \quad \bmod N\}
$$

are normal subgroups of $\mathrm{SL}(2, \mathbb{Z})$
(Double-cover) finite modular subgroups: $\Gamma_{N}^{\prime} \cong \mathrm{SL}(2, \mathbb{Z}) / \Gamma(N)$
$\Gamma_{N}^{\prime}=\left\langle\mathrm{S}, \mathrm{T} \mid \mathrm{S}^{4}=(\mathrm{ST})^{3}=T^{N}=\mathbb{1}, \quad \mathrm{S}^{2} \mathrm{~T}=\mathrm{TS}^{2}, \quad N=2,3,4,5\right\rangle$

$$
\Gamma_{2}^{\prime} \cong S_{3}, \Gamma_{3}^{\prime} \cong T^{\prime}, \Gamma_{4} \cong \mathrm{SL}(2,4), \Gamma_{5} \cong \mathrm{SL}(2,5), \ldots
$$

e.g. Liu, Ding (2019)

Finite modular subgroups: $\Gamma_{N} \cong \operatorname{PSL}(2, \mathbb{Z}) / \bar{\Gamma}(N)(\operatorname{PSL}(2, \mathbb{Z}) \cong \operatorname{SL}(2, \mathbb{Z}) /\{ \pm \mathbb{1}\})$

$$
\begin{gathered}
\Gamma_{N}=\left\langle\mathrm{S}, \mathrm{~T} \mid \mathrm{S}^{2}=(\mathrm{ST})^{3}=T^{N}=\mathbb{1}, \quad N=2,3,4,5\right\rangle \\
\Gamma_{2} \cong S_{3}, \Gamma_{3} \cong A_{4}, \Gamma_{4} \cong S_{4}, \Gamma_{5} \cong A_{5}, \ldots, \Gamma_{7} \cong \Sigma(168), \ldots
\end{gathered}
$$

e.g. de Adelhaart, Feruglio, Hagedorn (2011)

## Modular symmetries as flavor symmetries

Thus far, models with modular flavor symmetries are supersymmetric

## Modular symmetries as flavor symmetries

Thus far, models with modular flavor symmetries are supersymmetric Superfields build reps. of $\Gamma_{N}$ or $\Gamma_{N}^{\prime}$; transform as

$$
\Phi_{n_{i}} \xrightarrow{\gamma}(c T+d)^{n_{i}} \rho(\gamma) \Phi_{n_{i}}, \quad \Phi_{n_{i}} \in\left\{(e, \mu, \tau)^{T},(u, c, t)^{T}, \ldots\right\}
$$

$n_{i}$ : modular weight, $\rho(\gamma)$ : matrix rep. of $\gamma$ for $\Phi_{n_{i}}$

## Modular symmetries as flavor symmetries

Thus far, models with modular flavor symmetries are supersymmetric Superfields build reps. of $\Gamma_{N}$ or $\Gamma_{N}^{\prime}$; transform as

$$
\Phi_{n_{i}} \xrightarrow{\gamma}(c T+d)^{n_{i}} \rho(\gamma) \Phi_{n_{i}}, \quad \Phi_{n_{i}} \in\left\{(e, \mu, \tau)^{T},(u, c, t)^{T}, \ldots\right\}
$$

$n_{i}$ : modular weight, $\rho(\gamma)$ : matrix rep. of $\gamma$ for $\Phi_{n_{i}}$
Couplings $\hat{Y}^{\left(n_{Y}\right)}(T)$ are modular forms

$$
W \supset \sum \hat{Y}^{\left(n_{Y}\right)}(T) \Phi_{n_{1}} \Phi_{n_{2}} \Phi_{n_{3}}, \quad \hat{Y}^{\left(n_{Y}\right)} \xrightarrow{\gamma}(c T+d)^{n_{Y}} \rho(\gamma) \hat{Y}^{\left(n_{Y}\right)}
$$

$n_{Y}$ : modular weight, $\quad \rho(\gamma)$ : matrix rep. of $\gamma$ for $\hat{Y}^{\left(n_{Y}\right)}(T)$

## Modular symmetries as flavor symmetries

Thus far, models with modular flavor symmetries are supersymmetric Superfields build reps. of $\Gamma_{N}$ or $\Gamma_{N}^{\prime}$; transform as

$$
\Phi_{n_{i}} \xrightarrow{\gamma}(c T+d)^{n_{i}} \rho(\gamma) \Phi_{n_{i}}, \quad \Phi_{n_{i}} \in\left\{(e, \mu, \tau)^{T},(u, c, t)^{T}, \ldots\right\}
$$

$n_{i}$ : modular weight, $\rho(\gamma)$ : matrix rep. of $\gamma$ for $\Phi_{n_{i}}$
Couplings $\hat{Y}^{\left(n_{Y}\right)}(T)$ are modular forms

$$
W \supset \sum \hat{Y}^{\left(n_{Y}\right)}(T) \Phi_{n_{1}} \Phi_{n_{2}} \Phi_{n_{3}}, \quad \hat{Y}^{\left(n_{Y}\right)} \xrightarrow{\gamma}(c T+d)^{n_{Y}} \rho(\gamma) \hat{Y}^{\left(n_{Y}\right)}
$$

$n_{Y}$ : modular weight, $\rho(\gamma)$ : matrix rep. of $\gamma$ for $\hat{Y}^{\left(n_{Y}\right)}(T)$
Admissible iff
$W\left(\Phi_{n_{1}}, \ldots\right) \xrightarrow{\gamma}(c T+d)^{-1} \mathbb{1} W\left(\Phi_{n_{1}}, \ldots\right), \quad$ i.e. $n_{Y}+\sum n_{i}=-1, \quad \Pi \rho(\gamma)=\mathbb{1}$
Note the nontrivial automorphy factor $(c T+d)^{-1} \rightarrow W$ covariant

## How to proceed with modular flavor symmetries

- Take your favorite symmetry: $G_{m o d}=\Gamma_{N} \in\left\{S_{3}, A_{4}, S_{4}, A_{5}, \ldots\right\}$
- Choose your favorite representations $\rho(\gamma)$ for quark and lepton fields e.g. quark doublets $Q$ as $\mathbf{3}$ or $\mathbf{1} \oplus \mathbf{1}^{\prime} \oplus \mathbf{1}^{\prime \prime}$ of $\Gamma_{3} \cong A_{4}, \ldots$
- Pick your favorite modular weights $n_{i}$ and $n_{Y}$
- Write your $G_{m o d}$-covariant superpotential $W$

$$
\text { e.g. } W \supset \hat{Y}^{u} H_{u} Q \bar{u}+\hat{Y}^{d} H_{d} Q \bar{d}+\hat{Y}^{e} H_{d} L \bar{e}+\frac{\hat{Y}}{\Lambda} L H_{u} L H_{u}
$$

- Take your favorite inv. Kähler potential $K$; typical choice $K=\sum\left|\Phi_{n_{i}}\right|^{2}$ MANY other modular invariant $K$ possible! - Chen, SR-S, Ratz (1909.06910)
- Choose a $\langle T\rangle \neq 0 \rightarrow$ nontrivial rep. of $\hat{Y}(\langle T\rangle)$ breaks $G_{\text {mod }}$
- EW breakdown with $\left\langle H_{u}\right\rangle,\left\langle H_{d}\right\rangle \neq 0$
- Diagonalize quark and lepton matrices to compute $V_{C K M}$ and $U_{P M N S}$ and adjust only $\langle T\rangle$ to data

## Eclectic flavor symmetries

## From top-down to bottom-up eclectic flavor symmetries

## Eclectic flavor groups

Key observation: $T^{\prime}$ is an outer automorphism group of $\Delta(54) \odot$

## Eclectic flavor groups

Key observation: $T^{\prime}$ is an outer automorphism group of $\Delta(54) \odot$
Recipe to get the eclectic flavor group associated with a $G_{\text {flavor }}$ :

- Determine Out $\left(G_{\text {flavor }}\right)$

## Eclectic flavor groups

Key observation: $T^{\prime}$ is an outer automorphism group of $\Delta(54) \odot$
Recipe to get the eclectic flavor group associated with a $G_{\text {flavor }}$ :

- Determine Out $\left(G_{\text {flavor }}\right)$
- Pick two outer automorphisms satisfying modular $\Gamma_{N}$-like relations

## Eclectic flavor groups

Key observation: $T^{\prime}$ is an outer automorphism group of $\Delta(54) \odot$
Recipe to get the eclectic flavor group associated with a $G_{\text {flavor }}$ :

- Determine Out $\left(G_{\text {flavor }}\right)$
- Pick two outer automorphisms satisfying modular $\Gamma_{N}$-like relations
- Verify that there are suitable (triplet) representations for matter fields

## Eclectic flavor groups

Key observation: $T^{\prime}$ is an outer automorphism group of $\Delta(54) \odot$
Recipe to get the eclectic flavor group associated with a $G_{\text {flavor }}$ :

- Determine Out $\left(G_{\text {flavor }}\right)$
- Pick two outer automorphisms satisfying modular $\Gamma_{N}$-like relations
- Verify that there are suitable (triplet) representations for matter fields
- Determine which $G_{\text {modular }}$ is generated (via e.g. GAP)

## Eclectic flavor groups

Key observation: $T^{\prime}$ is an outer automorphism group of $\Delta(54) \odot$
Recipe to get the eclectic flavor group associated with a $G_{\text {flavor }}$ :

- Determine Out $\left(G_{\text {flavor }}\right)$
- Pick two outer automorphisms satisfying modular $\Gamma_{N}$-like relations
- Verify that there are suitable (triplet) representations for matter fields
- Determine which $G_{\text {modular }}$ is generated (via e.g. GAP)
- $G_{\text {eclectic }} \cong$ multiplicative closure of $G_{\text {flavor }}$ and $G_{\text {modular }}$

## Eclectic flavor groups

Key observation: $T^{\prime}$ is an outer automorphism group of $\Delta(54) ;$
Recipe to get the eclectic flavor group associated with a $G_{\text {flavor }}$ :

- Determine $\operatorname{Out}\left(G_{\text {flavor }}\right)$
- Pick two outer automorphisms satisfying modular $\Gamma_{N}$-like relations
- Verify that there are suitable (triplet) representations for matter fields
- Determine which $G_{m o d u l a r}$ is generated (via e.g. GAP)
- $G_{\text {eclectic }} \cong$ multiplicative closure of $G_{\text {flavor }}$ and $G_{\text {modular }}$
- Verify whether there is a third (class-inverting) outer automorphism that act as a $\mathbb{Z}_{2}$ CP-like transformation to further enhance the eclectic flavor symmetry

## Eclectic flavor groups

| flavor group $\mathcal{G}_{\text {fl }}$ | $\begin{gathered} \text { GAP } \\ \text { ID } \end{gathered}$ | $\operatorname{Aut}\left(\mathcal{G}_{\text {f }}\right)$ | finite modular groups |  | eclectic flavor group |
| :---: | :---: | :---: | :---: | :---: | :---: |

Nilles, SR-S, Vaudrevange (2001.01736)

## Back in the $\mathbb{T}^{2} / \mathbb{Z}_{3}$ example

## Restricted superpotential

$$
\Rightarrow \mathcal{W} \supset c\left[\hat{Y}_{2}(T)\left(X_{1} X_{2} X_{3}+Y_{1} Y_{2} Y_{3}+Z_{1} Z_{2} Z_{3}\right)\right.
$$

## Back in the $\mathbb{T}^{2} / \mathbb{Z}_{3}$ example

## Restricted superpotential

$$
\Rightarrow \mathcal{W} \supset c\left[\hat{Y}_{2}(T)\left(X_{1} X_{2} X_{3}+Y_{1} Y_{2} Y_{3}+Z_{1} Z_{2} Z_{3}\right)\right.
$$

More interestingly

$$
K=-\log (-\mathrm{i} T+\mathrm{i} T)+\sum_{i}(-\mathrm{i} T+\mathrm{i} T)^{-2 / 3}\left|\Phi_{-2 / 3}^{i}\right|^{2}
$$

Only canonical terms are allowed
$\rightarrow \quad$ predictability of bottom-up models with $\Gamma_{N}^{\prime}$ recovered!

## Towards the eclectic flavor picture

Use Narain formalism: split string in independent components

$$
X(\tau, \sigma)=X_{R}(\sigma-\tau)+X_{L}(\sigma+\tau)
$$

Groot-Nibbelink, Vaudrevange (2017)

## Towards the eclectic flavor picture

Use Narain formalism: split string in independent components

$$
X(\tau, \sigma)=X_{R}(\sigma-\tau)+X_{L}(\sigma+\tau)
$$

Groot-Nibbelink, Vaudrevange (2017)
Perform $\mathbb{T}^{2} / \Theta$ (e.g. $\Theta=\mathbb{Z}_{3}$ ) on each 2 D independent string component

$$
\mathcal{O}_{\text {Narain }}=\left(\mathbb{R}_{R}^{2} \otimes \mathbb{R}_{L}^{2}\right) / S_{\text {Narain }}
$$

## Towards the eclectic flavor picture

$$
\mathcal{O}_{\text {Narain }}=\left(\mathbb{R}_{R}^{2} \otimes \mathbb{R}_{L}^{2}\right) / S_{\text {Narain }}
$$

Inspiration: $C, P, T$ in SM are outer automorphisms of the Poincaré symmetry group

What are the outer automorphisms of $S_{\text {Narain }}=\{g\}$ ?

$$
\operatorname{Out}\left(S_{\text {Narain }}\right)=\left\{h=(\Sigma, t) \notin S_{\text {Narain }} \mid h g h^{-1} \in S_{\text {Narain }}\right\}
$$

Rotations: $h_{\Sigma}=(\Sigma, 0) \rightarrow O(2,2 ; \mathbb{Z}), \quad$ Translations: $h_{t}=\left(\mathbb{1}_{4}, t\right)$

## Towards the eclectic picture: what $\operatorname{Out}\left(S_{\text {Narain }}\right)$ is

String 2D toroidal compactifications have two moduli: $T, U$

$$
G=\frac{\operatorname{Im} T}{\operatorname{Im} U}\left(\begin{array}{cc}
1 & \operatorname{Re} U \\
\operatorname{Re} U & |U|^{2}
\end{array}\right), \quad B=\operatorname{Re} T\left(\begin{array}{cc}
0 & 1 \\
-1 & 0
\end{array}\right)
$$

## Towards the eclectic picture: what $\operatorname{Out}\left(S_{\text {Narain }}\right)$ is

String 2D toroidal compactifications have two moduli: $T, U$

$$
G=\frac{\operatorname{Im} T}{\operatorname{Im} U}\left(\begin{array}{cc}
1 & \operatorname{Re} U \\
\operatorname{Re} U & |U|^{2}
\end{array}\right), \quad B=\operatorname{Re} T\left(\begin{array}{cc}
0 & 1 \\
-1 & 0
\end{array}\right)
$$

Elements $h_{\Sigma} \in \operatorname{Out}\left(S_{\text {Narain }}\right)$ transform metric $G$, thus $T, U$ !!

## Towards the eclectic picture: what $\operatorname{Out}\left(S_{\text {Narain }}\right)$ is

$$

M: mirror symmetry, $\quad \mathrm{K}_{*}$ : $\mathcal{C} \mathcal{P}$-like transformation $\odot$
Nilles, Ratz, Trautner, Vaudrevange (2018); Novichkov, Penedo, Petcov, Titov (2019)
Further, $\left\{h_{t}\right\}$ don't change $T, U$, but do transform fields $\rightarrow$ traditional flavor symmetry

## Common origin of modular and traditional flavor

Modular weights $n_{i}$, representations and couplings of $\Phi_{n_{i}}$ not $a d$ hoc!

## Common origin of modular and traditional flavor

Modular weights $n_{i}$, representations and couplings of $\Phi_{n_{i}}$ not ad hoc!
Example $\mathbb{T}^{2} / \mathbb{Z}_{3}$ : must fix $U$ to $\langle U\rangle=\omega=e^{2 \pi \mathrm{i} / 3} \rightarrow$ broken $\operatorname{SL}(2, \mathbb{Z})_{U}$

By using CFT formalism, inspect $\mathrm{SL}(2, \mathbb{Z})_{T}$ on the triplet of matter fields:

$$
h_{\Sigma}: \rho\left(\mathrm{S}_{T}\right)=\frac{\mathrm{i}}{\sqrt{3}}\left(\begin{array}{ccc}
1 & 1 & 1 \\
1 & \omega^{2} & \omega \\
1 & \omega & \omega^{2}
\end{array}\right), \quad \rho\left(\mathrm{T}_{T}\right)=\left(\begin{array}{ccc}
\omega^{2} & 0 & 0 \\
0 & 1 & 0 \\
0 & 0 & 1
\end{array}\right)
$$

$\rho\left(\mathrm{S}_{T}\right)$ and $\rho\left(\mathrm{S}_{T}\right)$ build the reps. $\mathbf{2}^{\prime} \oplus \mathbf{1}$ of modular group $\Gamma_{3}^{\prime}=T^{\prime} \odot$

$$
\Phi_{n=-2 / 3,-5 / 3} \xrightarrow{\mathrm{~S}_{T}}(-T)^{n} \rho\left(\mathrm{~S}_{T}\right) \Phi_{n}, \quad \Phi_{n} \xrightarrow{\mathrm{~T}_{T}} \rho\left(\mathrm{~T}_{T}\right) \Phi_{n}
$$

## Common origin of modular and traditional flavor

Modular weights $n_{i}$, representations and couplings of $\Phi_{n_{i}}$ not ad hoc!
Example $\mathbb{T}^{2} / \mathbb{Z}_{3}$ : must fix $U$ to $\langle U\rangle=\omega=e^{2 \pi \mathrm{i} / 3} \rightarrow$ broken $\operatorname{SL}(2, \mathbb{Z})_{U}$

By using CFT formalism, inspect $\mathrm{SL}(2, \mathbb{Z})_{T}$ on the triplet of matter fields:

$$
h_{t}: \rho(\mathrm{A})=\left(\begin{array}{ccc}
0 & 1 & 0 \\
0 & 0 & 1 \\
1 & 0 & 0
\end{array}\right), \rho(\mathrm{B})=\left(\begin{array}{ccc}
1 & 0 & 0 \\
0 & \omega & 0 \\
0 & 0 & \omega^{2}
\end{array}\right), \rho(\mathrm{C})=\rho\left(\mathrm{S}_{T}^{2}\right)
$$

$\rho(\mathrm{A}), \rho(\mathrm{B})$ and $\rho(\mathrm{C})$ build the reps $3_{2(1)}$ and $3_{1(1)}$ of traditional flavor group $\Delta(54)$ for $\Phi_{-2 / 3}$ and $\Phi_{-5 / 3} \quad$ cf. also in Kobayshi, Plöger, Niles, Raby, Ratz (2006)

## Common origin of modular and traditional flavor

Modular weights $n_{i}$, representations and couplings of $\Phi_{n_{i}}$ not ad hoc!
Example $\mathbb{T}^{2} / \mathbb{Z}_{3}$ : must fix $U$ to $\langle U\rangle=\omega=e^{2 \pi \mathrm{i} / 3} \rightarrow$ broken $\operatorname{SL}(2, \mathbb{Z})_{U}$

first eclectic flavor symmetry: modular + traditional flavor

$$
\begin{gathered}
\Delta(54) \cup T^{\prime} \cong \Omega(1)=S G[648,533] \\
\text { with } \mathcal{C P}: \Delta(54) \cup T^{\prime} \cup \mathbb{Z}_{2}^{\mathcal{C} \mathcal{P}} \cong S G[1296,2891]
\end{gathered}
$$

## Common origin of modular and traditional flavor

Modular weights $n_{i}$, representations and couplings of $\Phi_{n_{i}}$ not ad hoc!
Example $\mathbb{T}^{2} / \mathbb{Z}_{3}$ : must fix $U$ to $\langle U\rangle=\omega=e^{2 \pi \mathrm{i} / 3} \rightarrow$ broken $\operatorname{SL}(2, \mathbb{Z})_{U}$

first eclectic flavor symmetry: modular + traditional flavor
