Looking for Dark Matter at the DAMIC-M experiment

X. Bertou on behalf of DAMIC-M

XV Latin American Symposium on High Energy Physics

Direct search for Dark Matter

Skipper CCDs as Dark Matter detectors

Dark Matter in CCD (DAMIC) @SNOLAB

DAMIC @ SNOLAB excess

Regular CCD: • 11 kg.day Skipper CCD: • 4.8 kg.day

> Unexpected new source of background (potential signal incompatible with Dark Side limits)

Dark Matter in CCD at Modane

- Physics goal: detect nuclear and electron recoils to search for light dark matter candidates (eV to GeV)
- LSM (1700 m of rock overburden, 4800 mwe)
- Mode of operation:
 - Use thick (675 um), massive (~ 3.4 g), 9 Mpix skipper CCDs
 - skipper guarantees calibration and single electron threshold
 - CCD gives imaging technique for defect rejection
 - Array of 212 CCDs for kg-scale mass
 - Achieve ~ 0.5 dru background rate (0.5 event/keV/kg/day)
 - 1kg-year exposure to reach discovery potential

Electron recoil: DAMIC-M and Dark Sector

ultra-light mediator

Background mitigation challenge

- Reduce silicon activation (expedite production, underground storage, transport in a container with 16-ton iron shielding)
- Strict control of exposure to Radon and dust, chemical cleaning
- Ultra-clean flex cables
- Underground machined electro-formed copper
- Ancient lead + low activity lead shielding
- Design validation with Geant4

Low Background Chamber (LBC)

CCD controllers and power supplies

Support structure Vacuum pump and pressure gauges

LBC science run

- Cluster and CTI removal (less that 1% of data)
- Hot columns removal (~30% of data)

First Constraints from DAMIC-M on Sub-GeV Dark-Matter Particles Interacting with Electrons

I. Arnquist et al. (DAMIC-M Collaboration) Phys. Rev. Lett. **130**, 171003 (2023) – Published 28 April 2023

World-leading constraints are placed on electron interactions with dark matter in the MeV to GeV range by the first underground operation of a new CCD detector. Show Abstract +

Current world-leading peer reviewed limits for dark sector in most of the mass range Phys. Rev. Lett. **130**, 171003 – Published 28 April 2023

Dark Matter daily modulation signal

In the currently explored parameter space, the Earth is not transparent and a daily modulation is expected due to the dark matter wind

Phys. Rev. Lett. 132, 101006 – Published 7 March 2024

19/21

9

4 6kx1.5k CCD per module (13.4g)

۲

First 2 modules installed at LBC

- New CCDs
- Lower DC
 - Improved cabling
 - Improved readout
 - Better IR photon shield
- DC down by a factor 20 ~ 500 e⁻/g.day (in constant readout mode on most of the CCD)

Conclusions

- DAMIC-M will explore the region of parameter where dark sector is expected (freeze-in/freeze-out) within 2 years
- It will also explore the current DAMIC@SNOLAB excess
- Current LBC prototype operated with great success
 - Best peer reviewed Dark Sector limits in most of the mass range
 - Spectral analysis of the observed charge histograms
 - Daily modulation of the 1 e⁻ rate at lowest masses
- DAMIC-M CCDs are being packaged
 - First data are promising (DC lowered by 20)
 - Stay tuned for first results very soon
