

# Measurement of the $B^+$ differential cross section as a function of transverse momentum and multiplicity in pPb collisions at 8.16 TeV

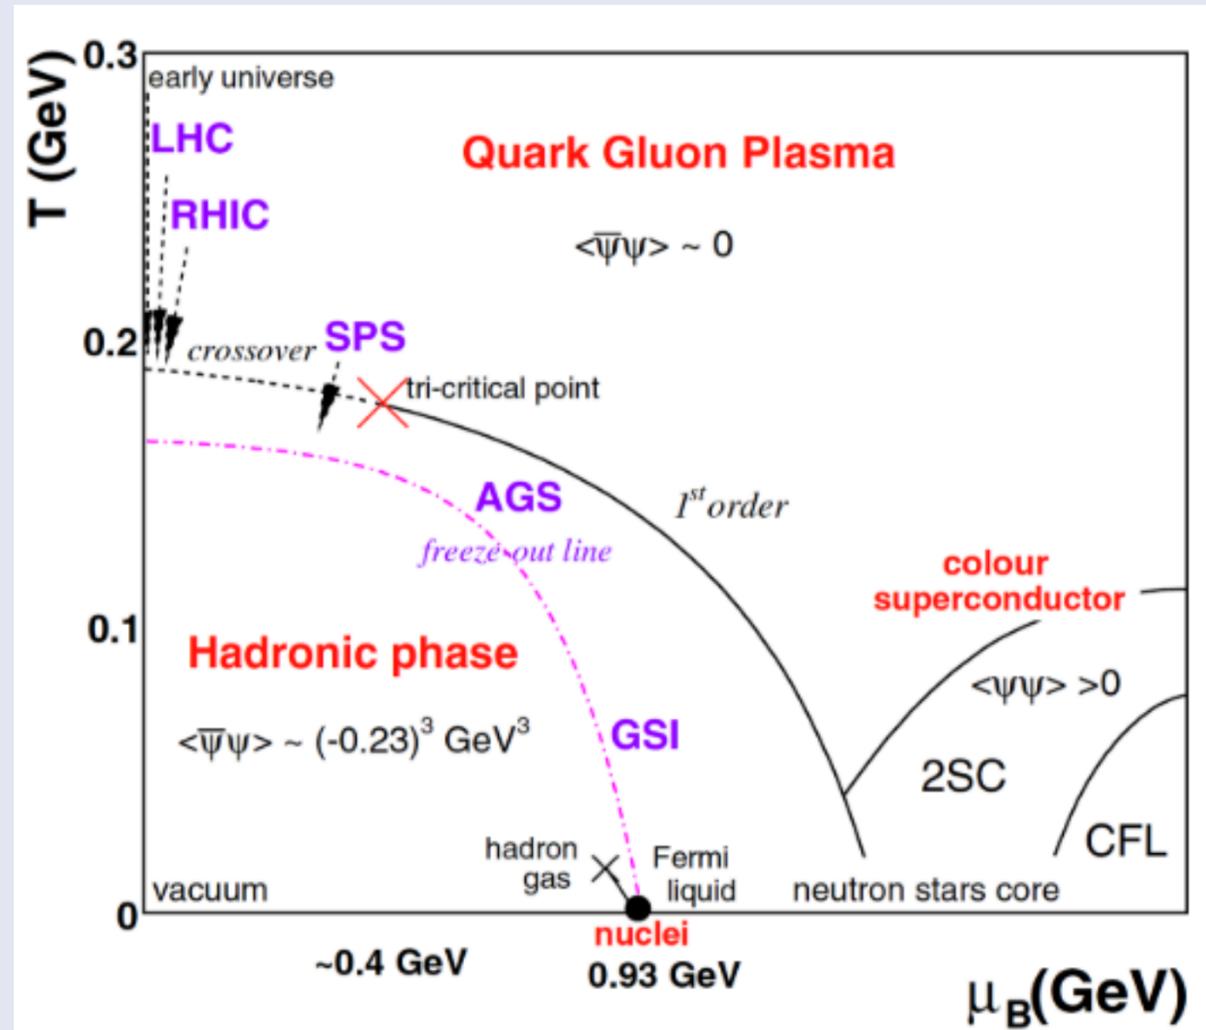

Reunión Anual de la División de Partículas y Campos 2024  
Ciudad de México. June 05, 2024.

**Camilo J. Torres Castaño (BUAP-FCFM)**

Dr. Jhovanny Mejía Guisao, Dra. Irais Bautista Guzman,  
Dr. Rogelio Reyes-Almanza, Dr. Heriberto Castilla Valdez

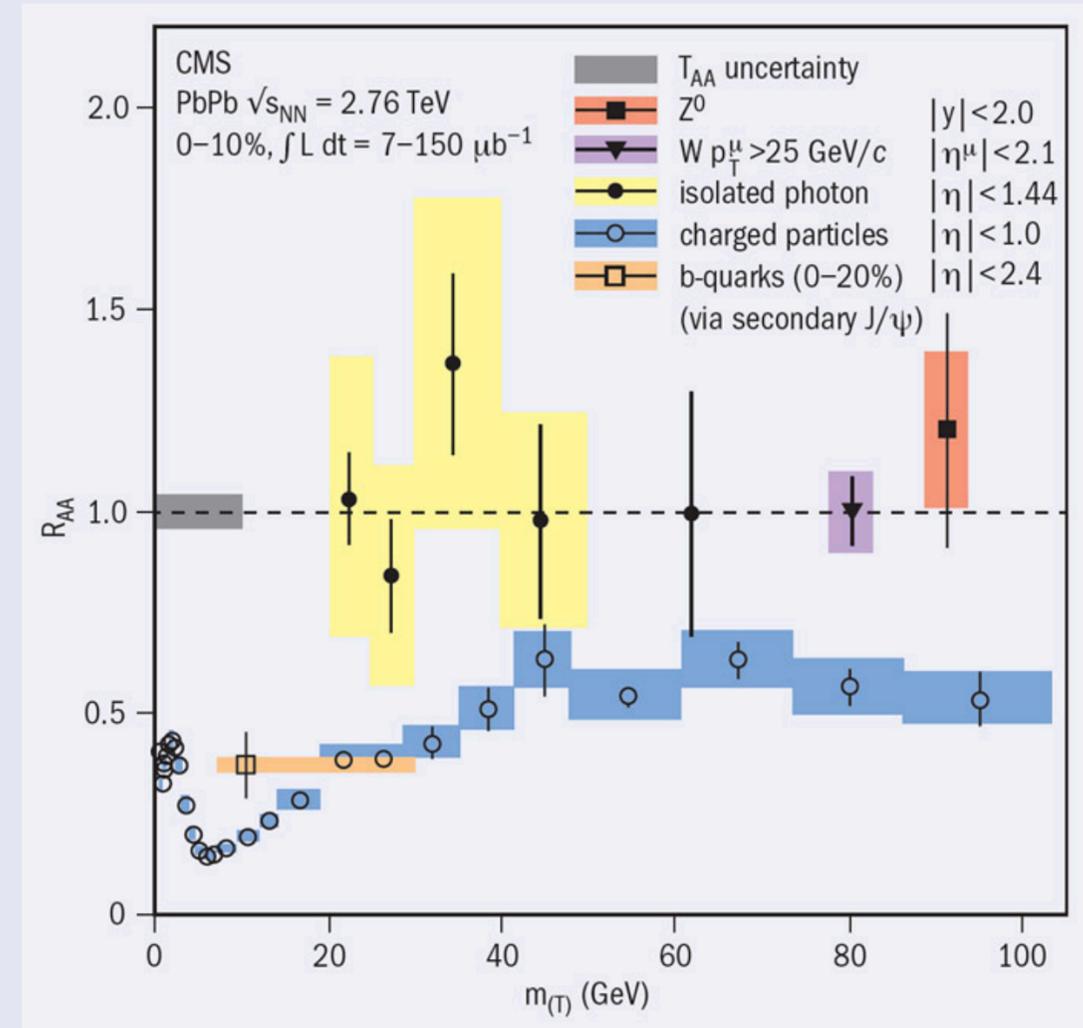

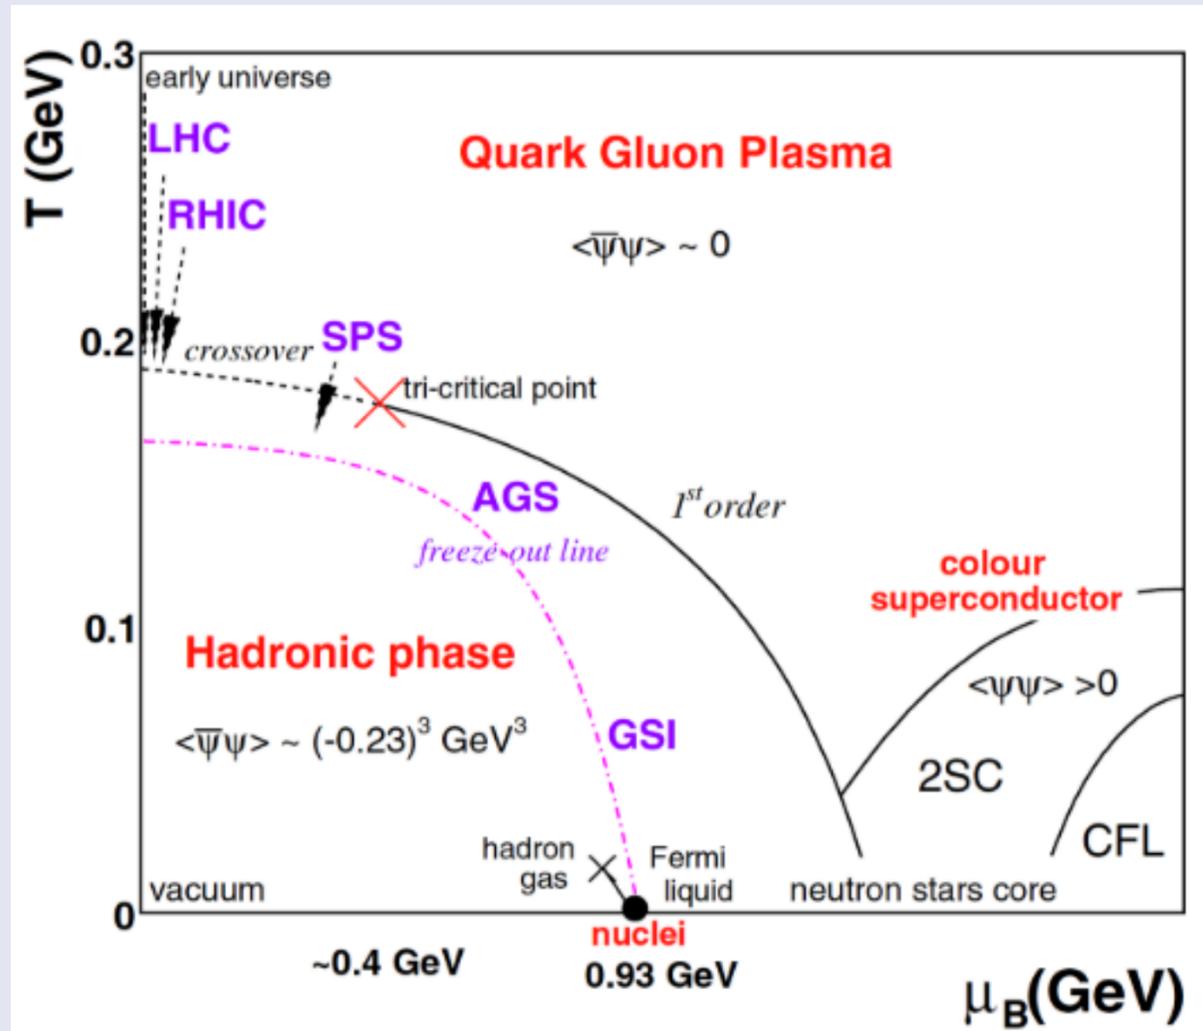

1. Motivation and previous results: Some insights in b-mesons nuclear modification factor and multiplicity studies.
  - 1.1. Study of B meson production in pPb collisions at 5.02 TeV using exclusive hadronic decays
  - 1.2. Nuclear modification factor in pPb collisions for B<sup>+</sup> mesons as function of  $y$  and as a function of  $p_T$
  - 1.3. Multiplicity dependence of charm baryon and meson production in pPb collisions at 8.16 TeV
2. Measurement of the B<sup>+</sup> differential cross section as a function of transverse momentum and multiplicity in pPb collisions at 8.16 TeV
  - 2.1. Data sets and selection details
  - 2.2. Dimuon trigger
  - 2.3. Charged-particle multiplicity
  - 2.4. Invariant mass distribution
  - 2.5. Monte Carlo and Efficiency
  - 2.6. Differential cross section
  - 2.7. B<sup>+</sup> cross section in multiplicity classes
3. Conclusions and next steps

# Motivation and previous results: Some insights in b-mesons nuclear modification factor and multiplicity studies.

The schematic phase diagram of QCD in terms of  $T$ , showing the QGP state. [1]

# Motivation and previous results: Some insights in b-mesons nuclear modification factor and multiplicity studies.

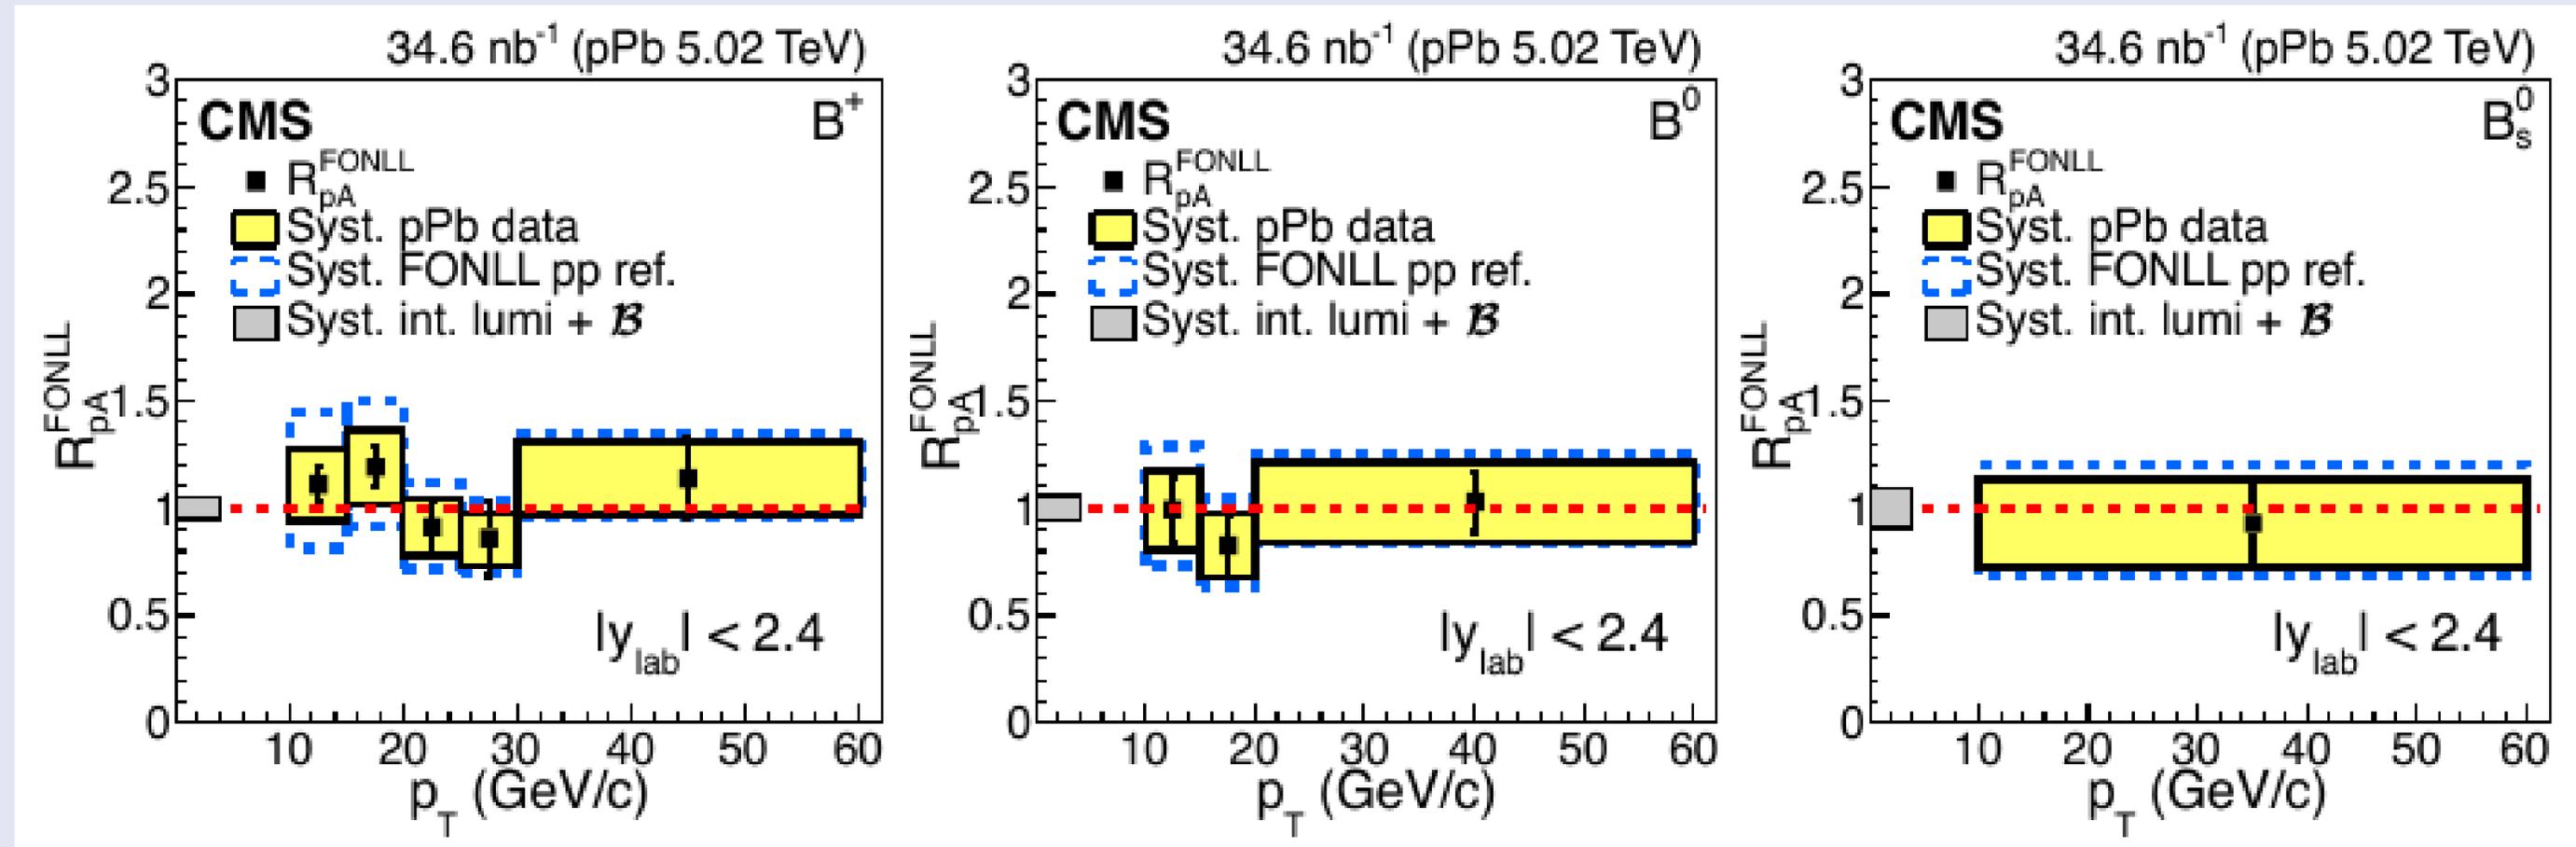

The schematic phase diagram of QCD in terms of  $T$ , showing the QGP state. [1]

The nuclear modification factor is a quantity that measures the production suppression due to in-medium collective effects. [2]

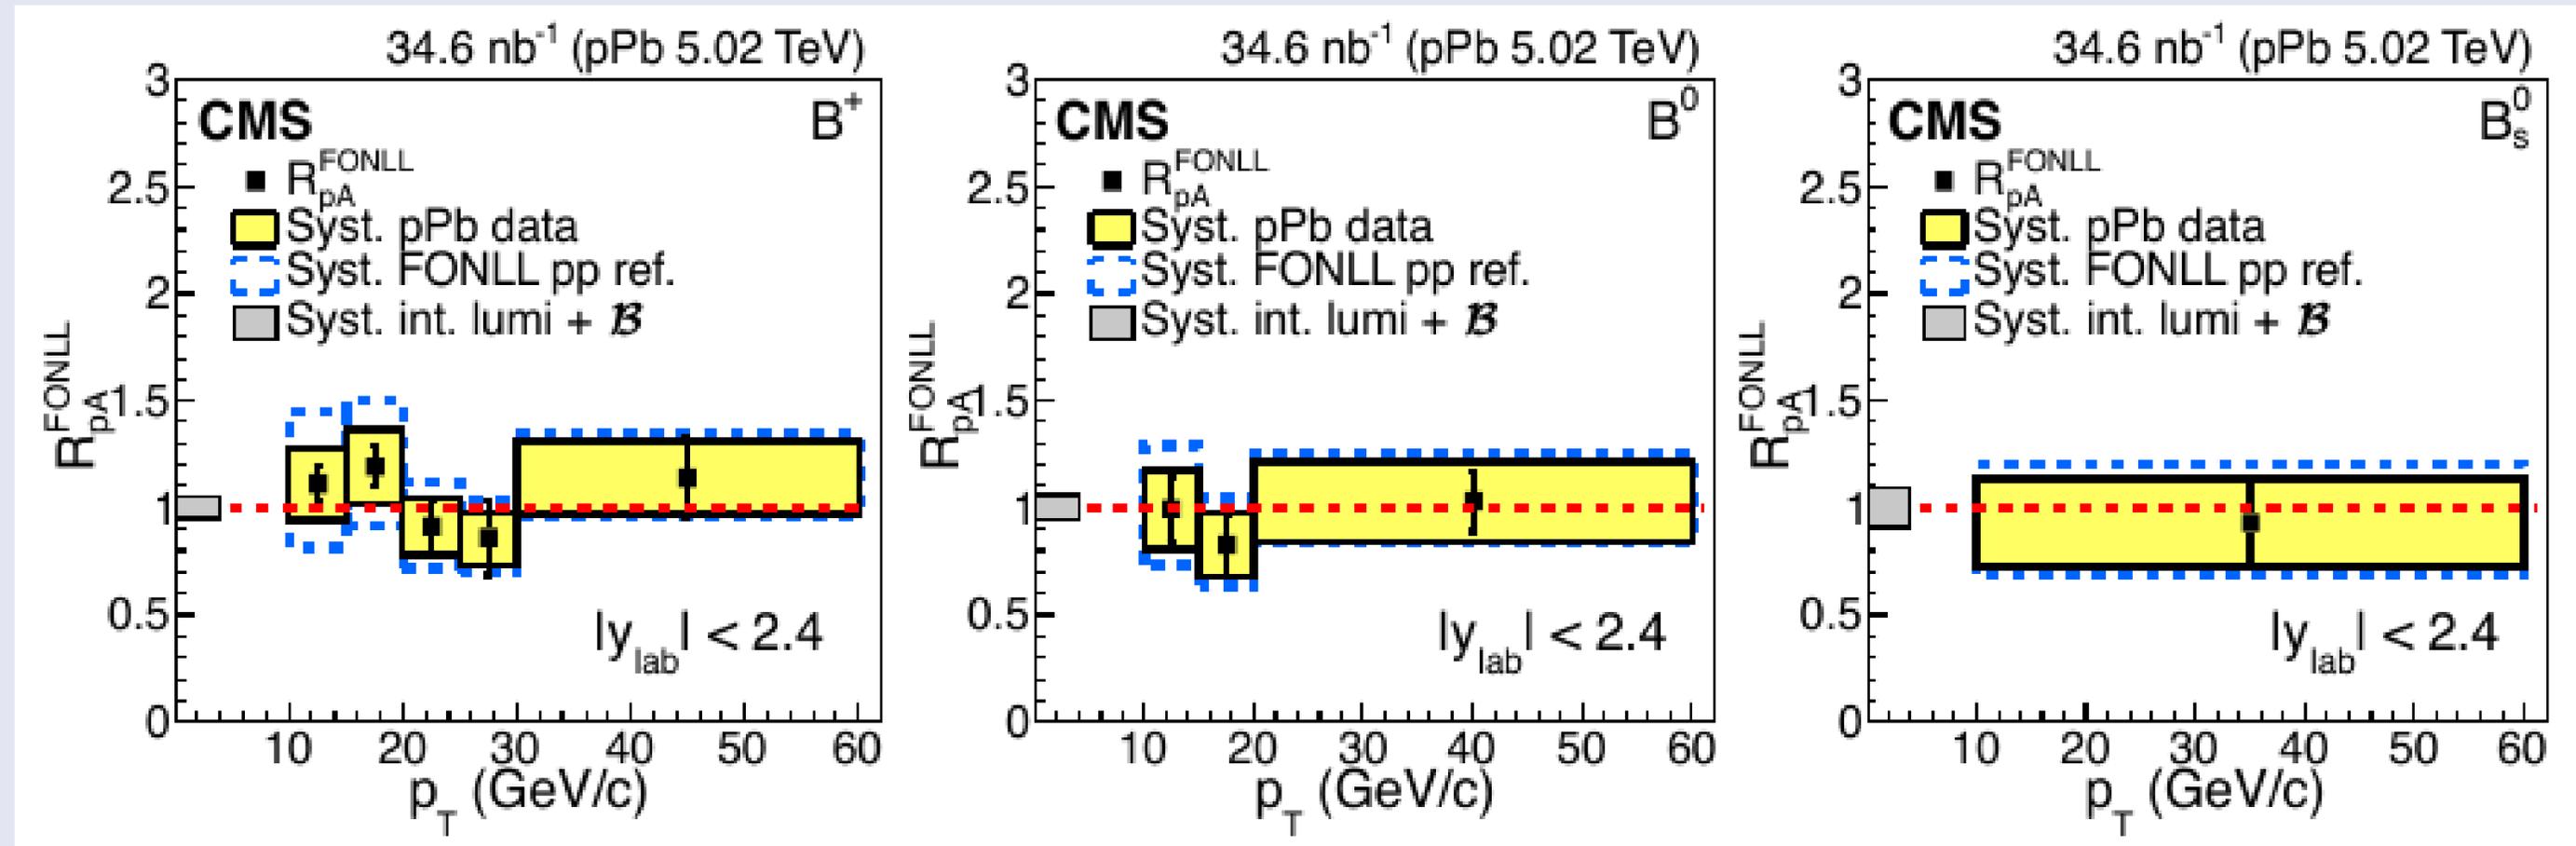

# Study of B meson production in pPb collisions at 5.02 TeV using exclusive hadronic decays

[3] CMS HIN-14-004  
*Phys. Rev. Lett.* 116 (2016) 032301

# Study of B meson production in pPb collisions at 5.02 TeV using exclusive hadronic decays

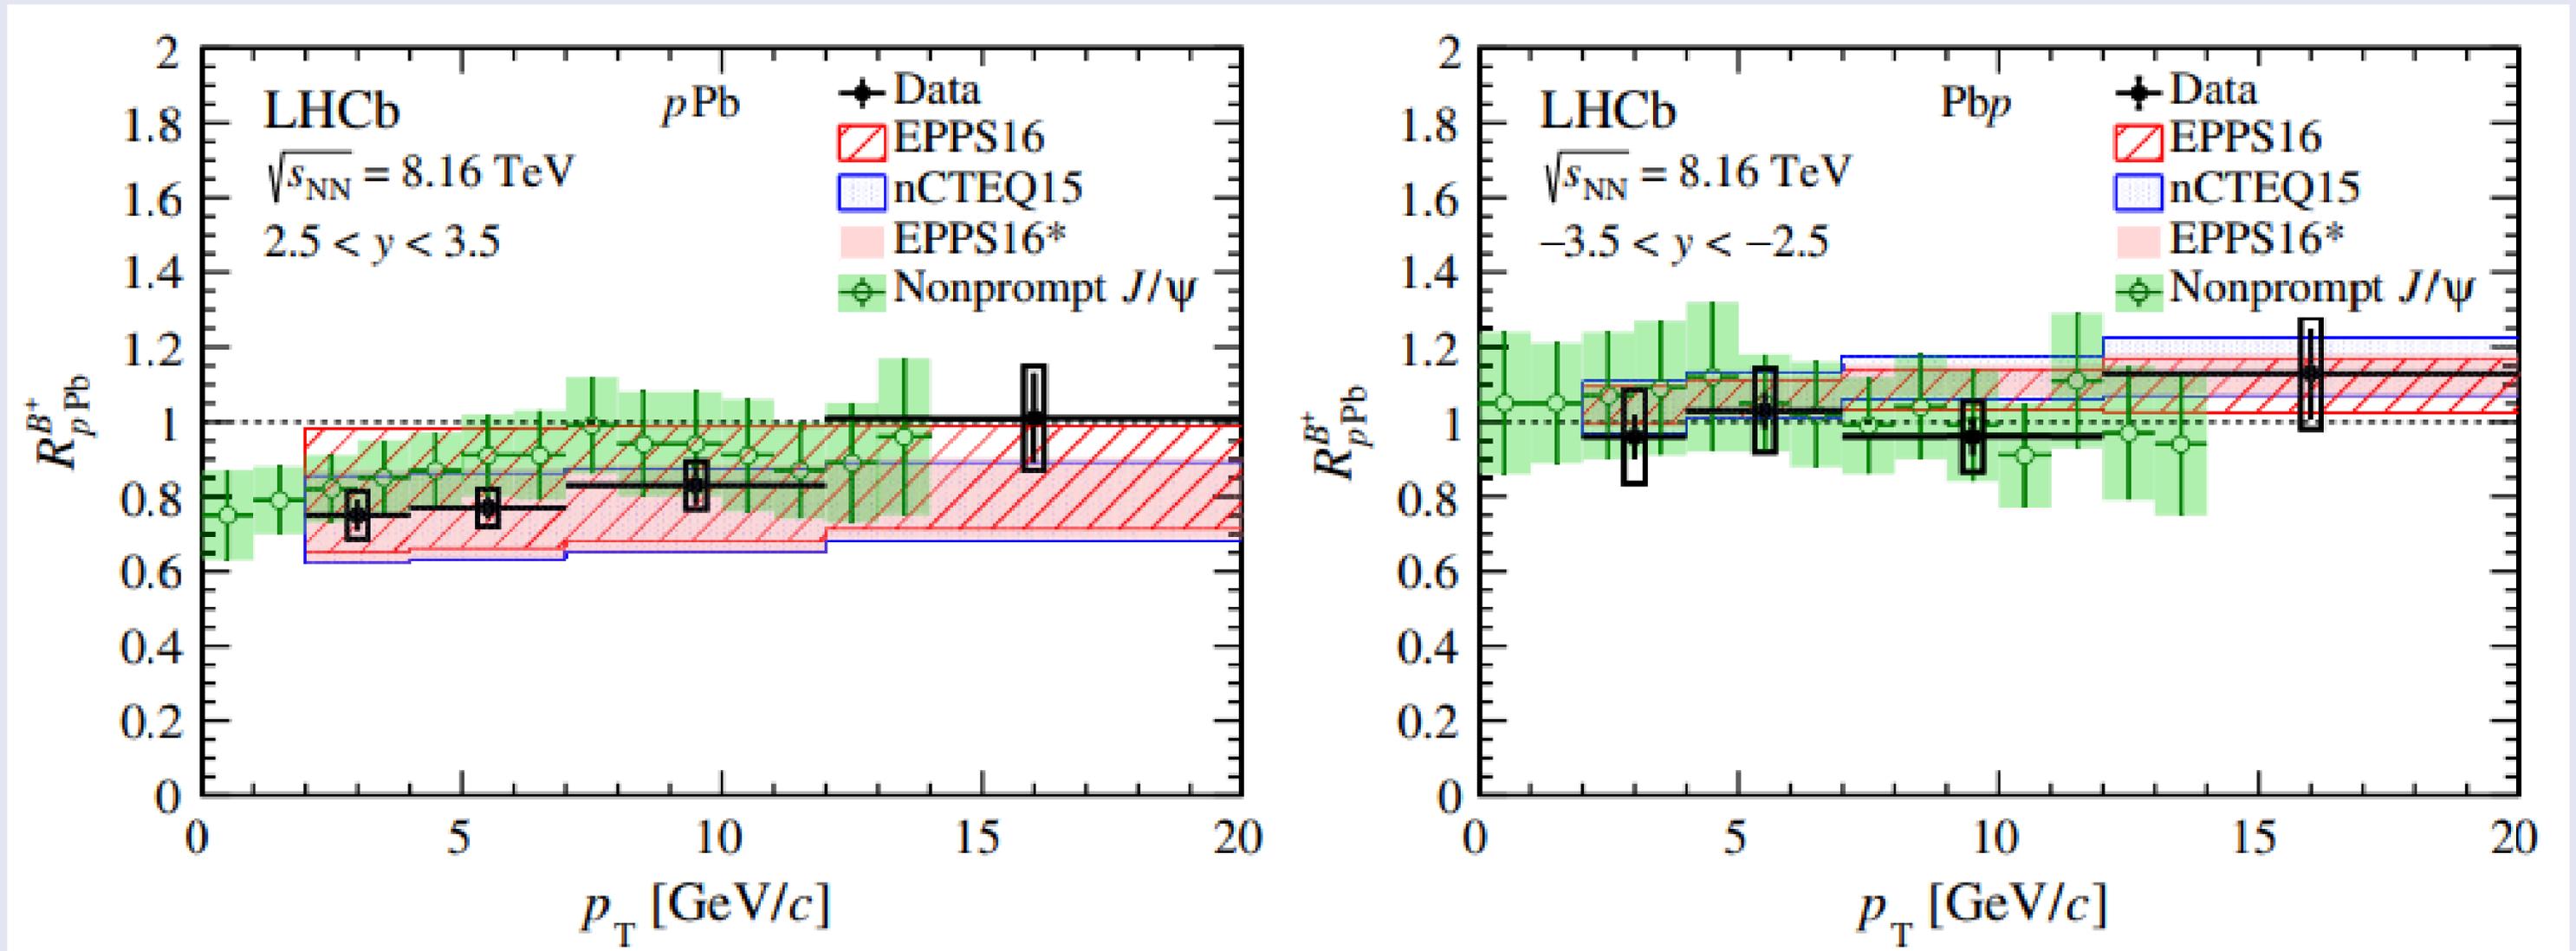

[4] CMS HIN-14-004  
*Phys. Rev. Lett.* 116 (2016) 032301

- The nuclear modification factors of the three B mesons do not show evidence for modification of pPb data compared to the FONLL reference
- These results provide a baseline for the study of in-medium b quark energy loss in PbPb collisions.

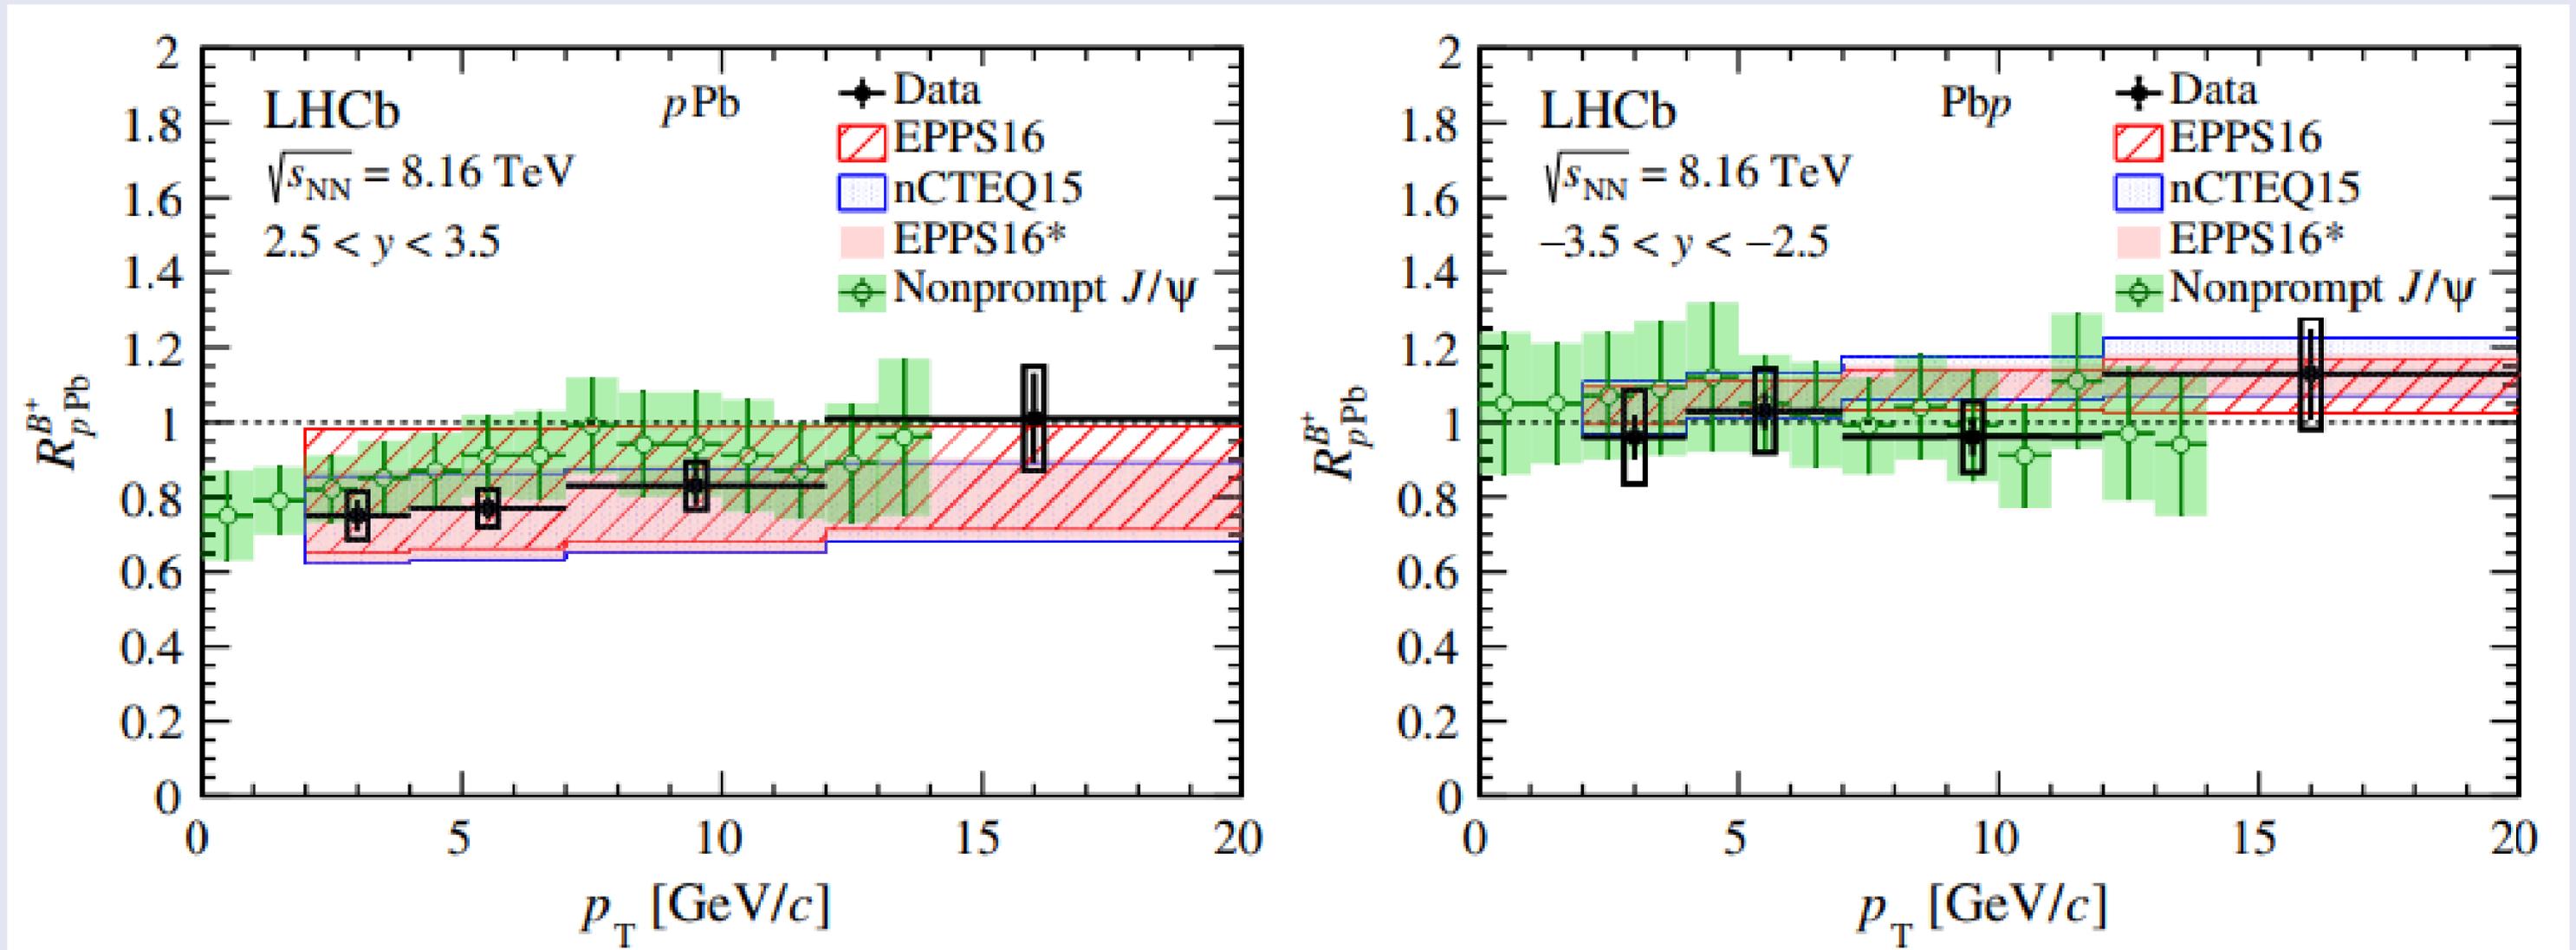

# Nuclear modification factor in pPb collisions for B<sup>+</sup> mesons as function of y and as a function of p<sub>T</sub>

[4] LHCb Collaboration  
Phys. Rev. D 99, (2019) 052011

# Nuclear modification factor in pPb collisions for B<sup>+</sup> mesons as function of y and as a function of p<sub>T</sub>

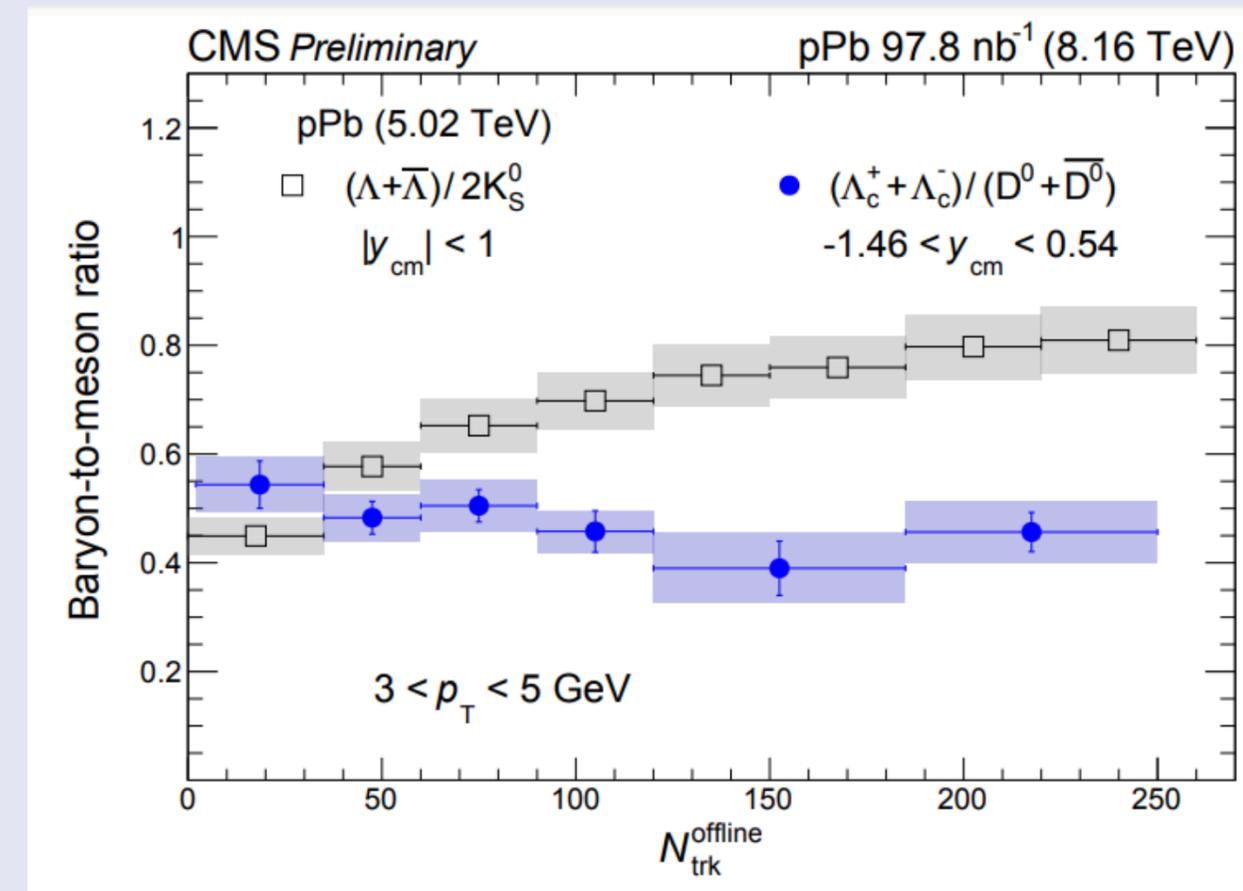

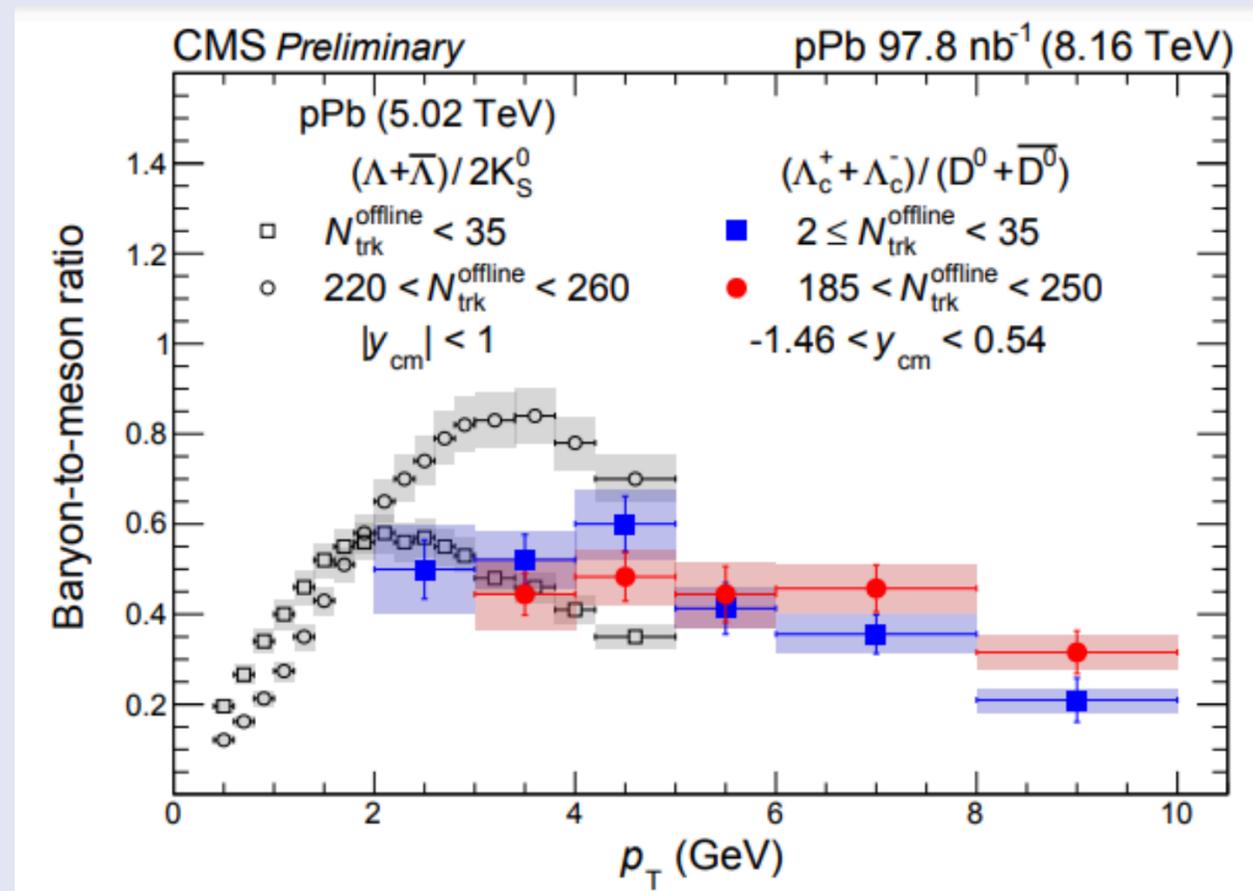

[4] LHCb Collaboration  
Phys. Rev. D 99, (2019) 052011

- Forward-to-backward nuclear modification factors indicate a significant nuclear suppression at positive rapidity.

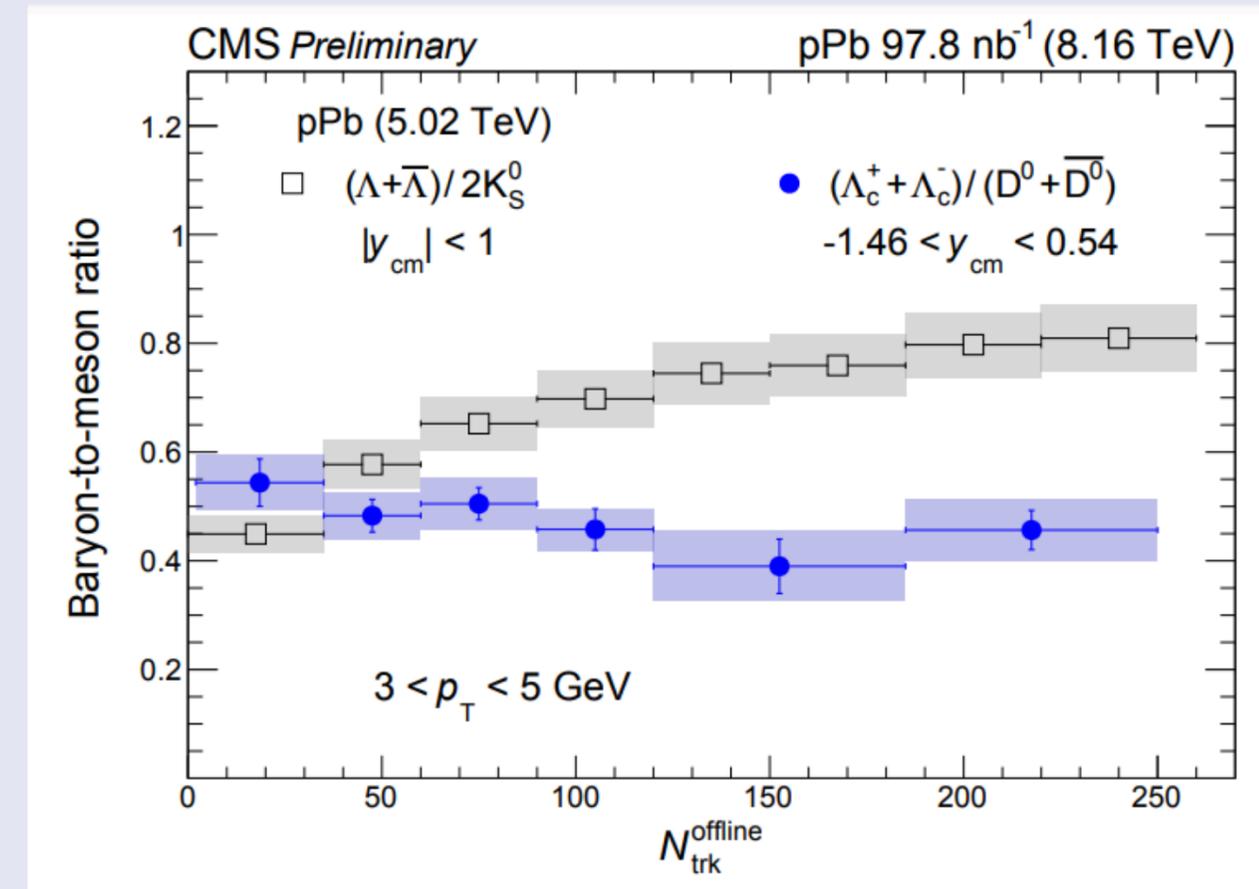

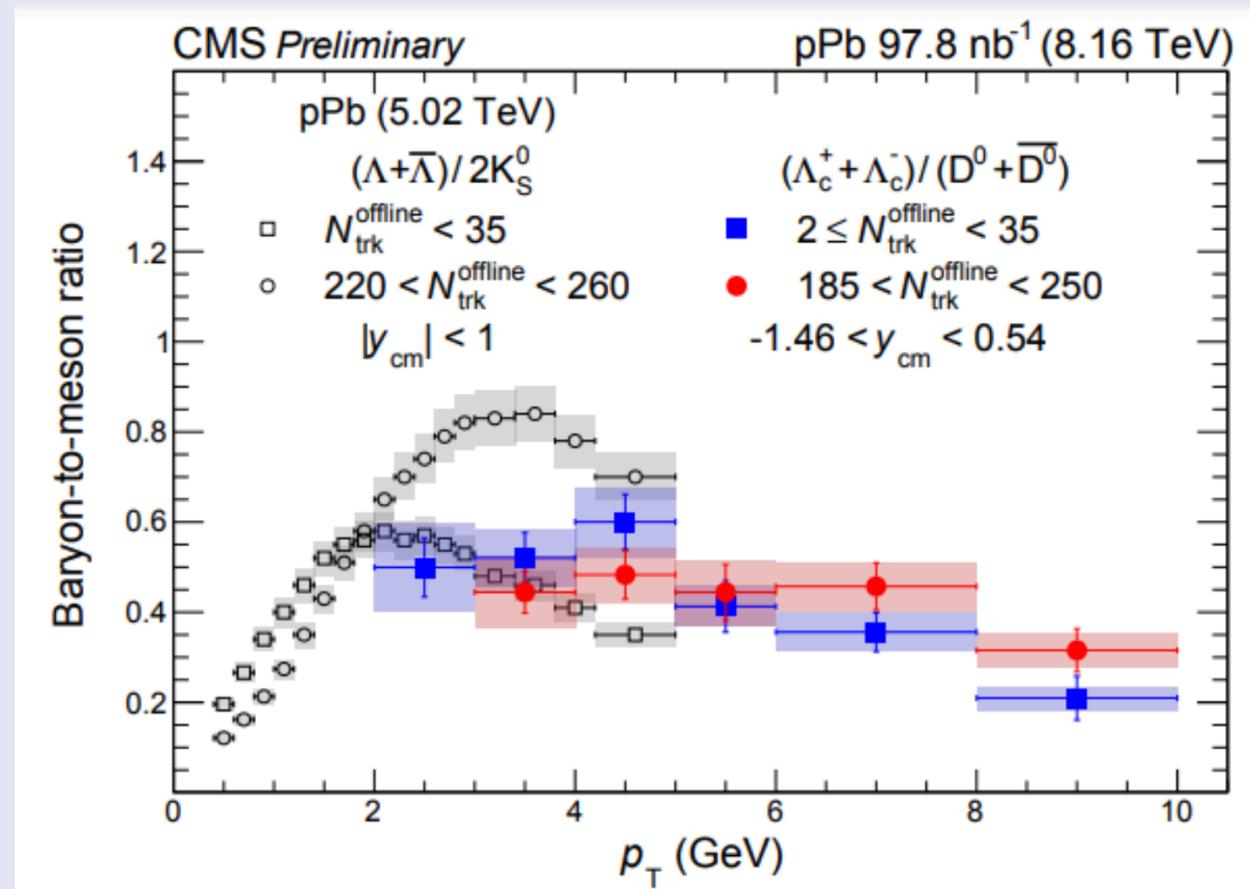

# Multiplicity dependence of charm baryon and meson production in pPb collisions at 8.16 TeV

[5] [CMS-PAS-HIN-21-016](#)

# Multiplicity dependence of charm baryon and meson production in pPb collisions at 8.16 TeV

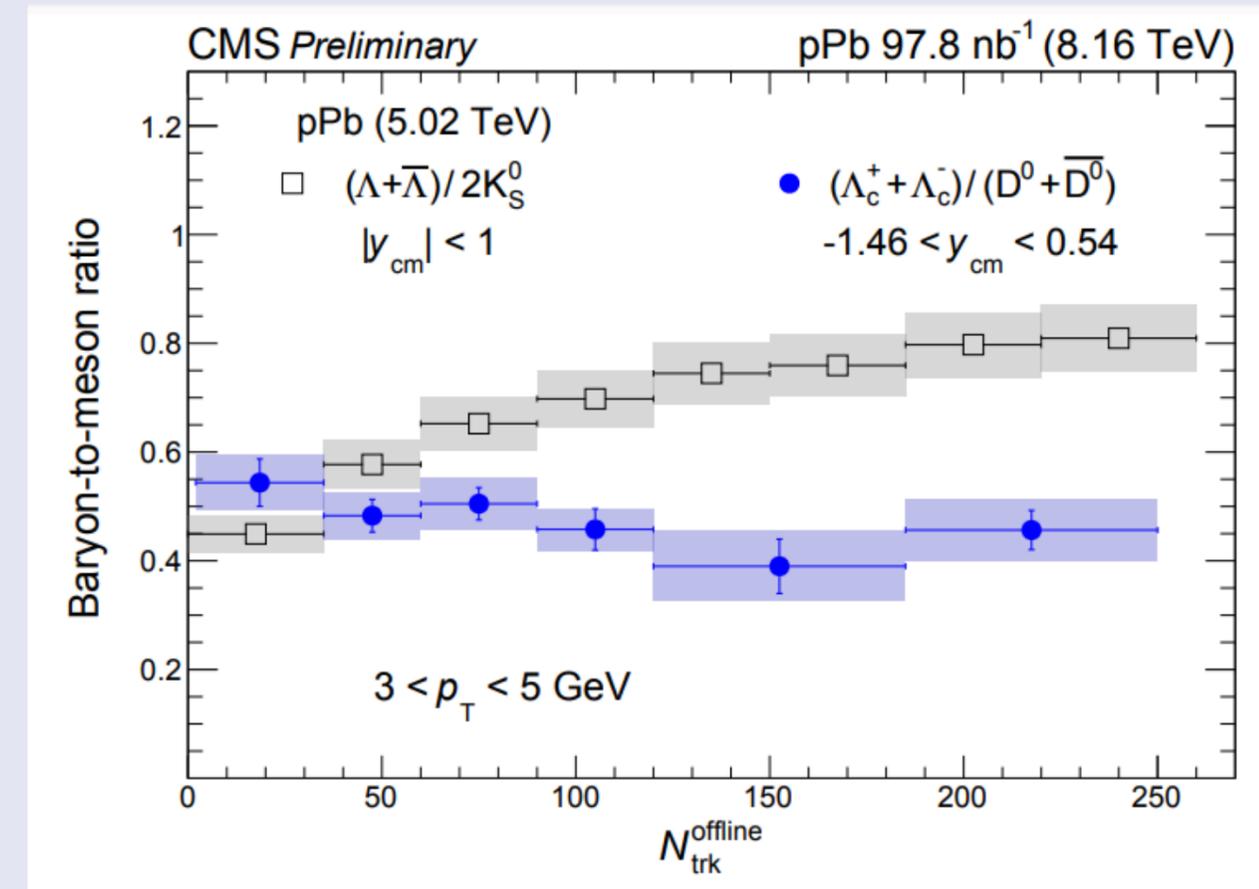

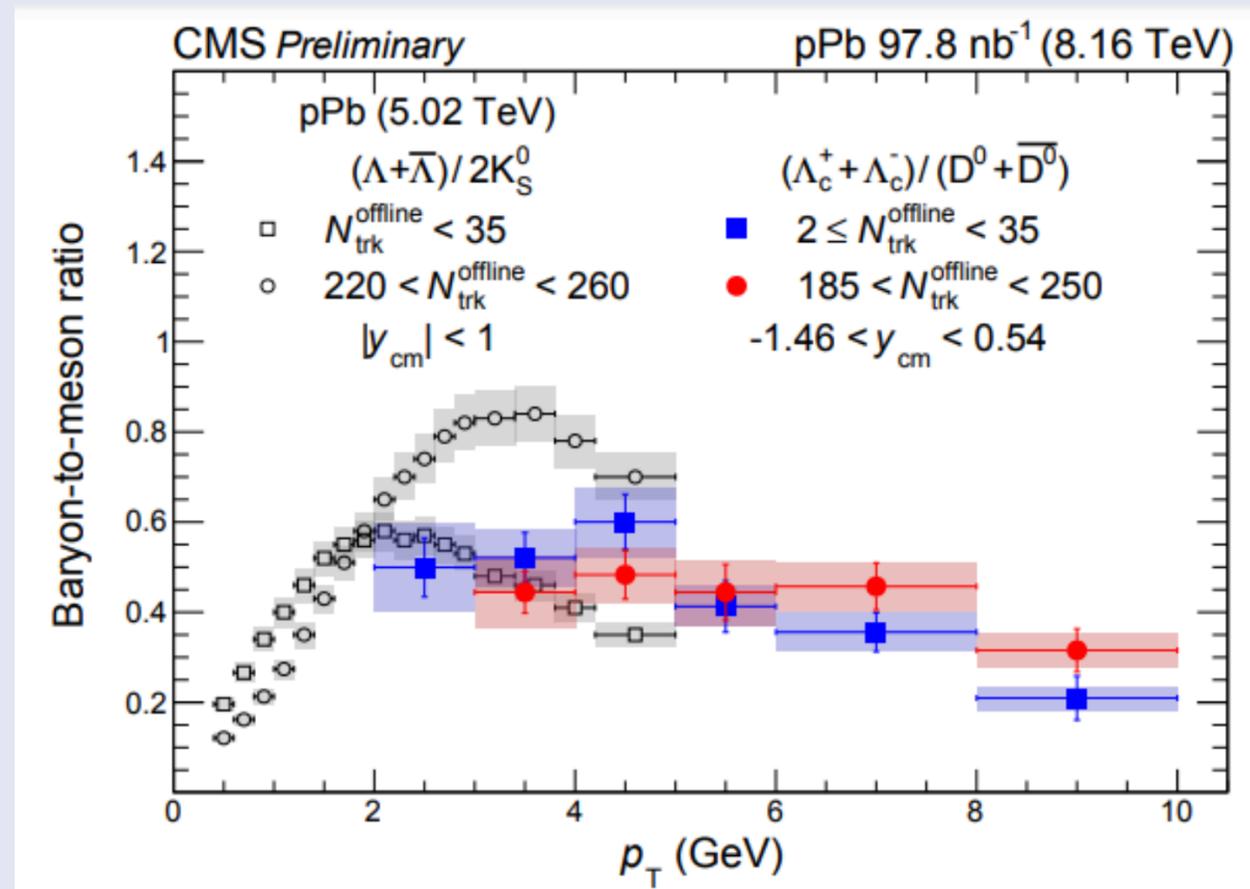

[5] [CMS-PAS-HIN-21-016](#)

- Evidence of charm hadronization mechanism possibly in presence of a dense medium produced in high-multiplicity pPb collisions.

# Multiplicity dependence of charm baryon and meson production in pPb collisions at 8.16 TeV

[5] [CMS-PAS-HIN-21-016](#)

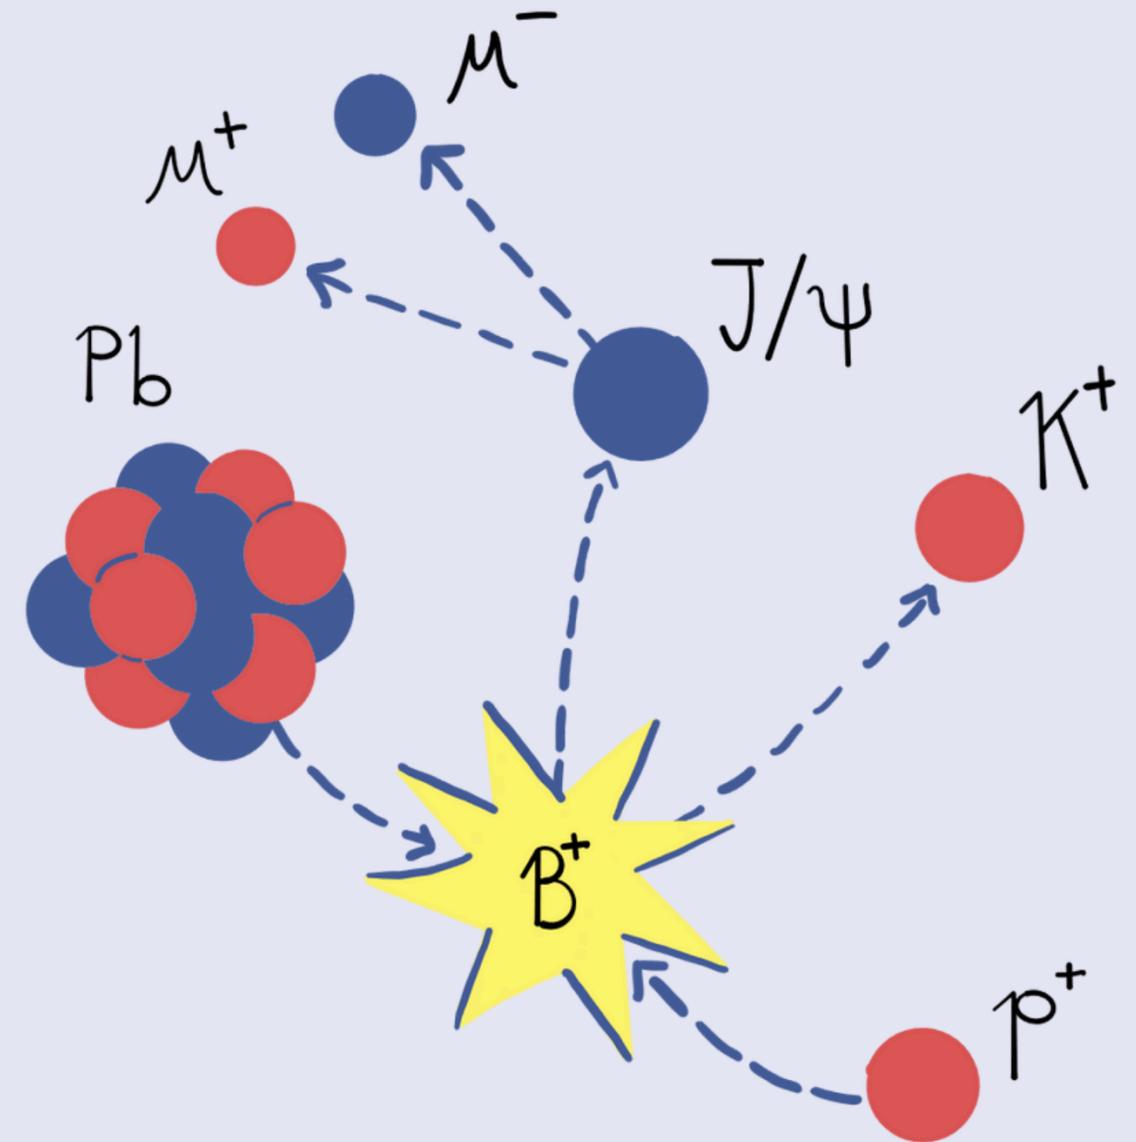

- Evidence of charm hadronization mechanism possibly in presence of a dense medium produced in high-multiplicity pPb collisions.
- Reported results may indicate different event multiplicity evolution of hadronization mechanism for charm quarks than light flavor strange quarks

[6] CMS-PAS-HIN-22-001

Measurement of the  $B^+$  differential cross section as a function of transverse momentum and multiplicity in pPb collisions at 8.16 TeV

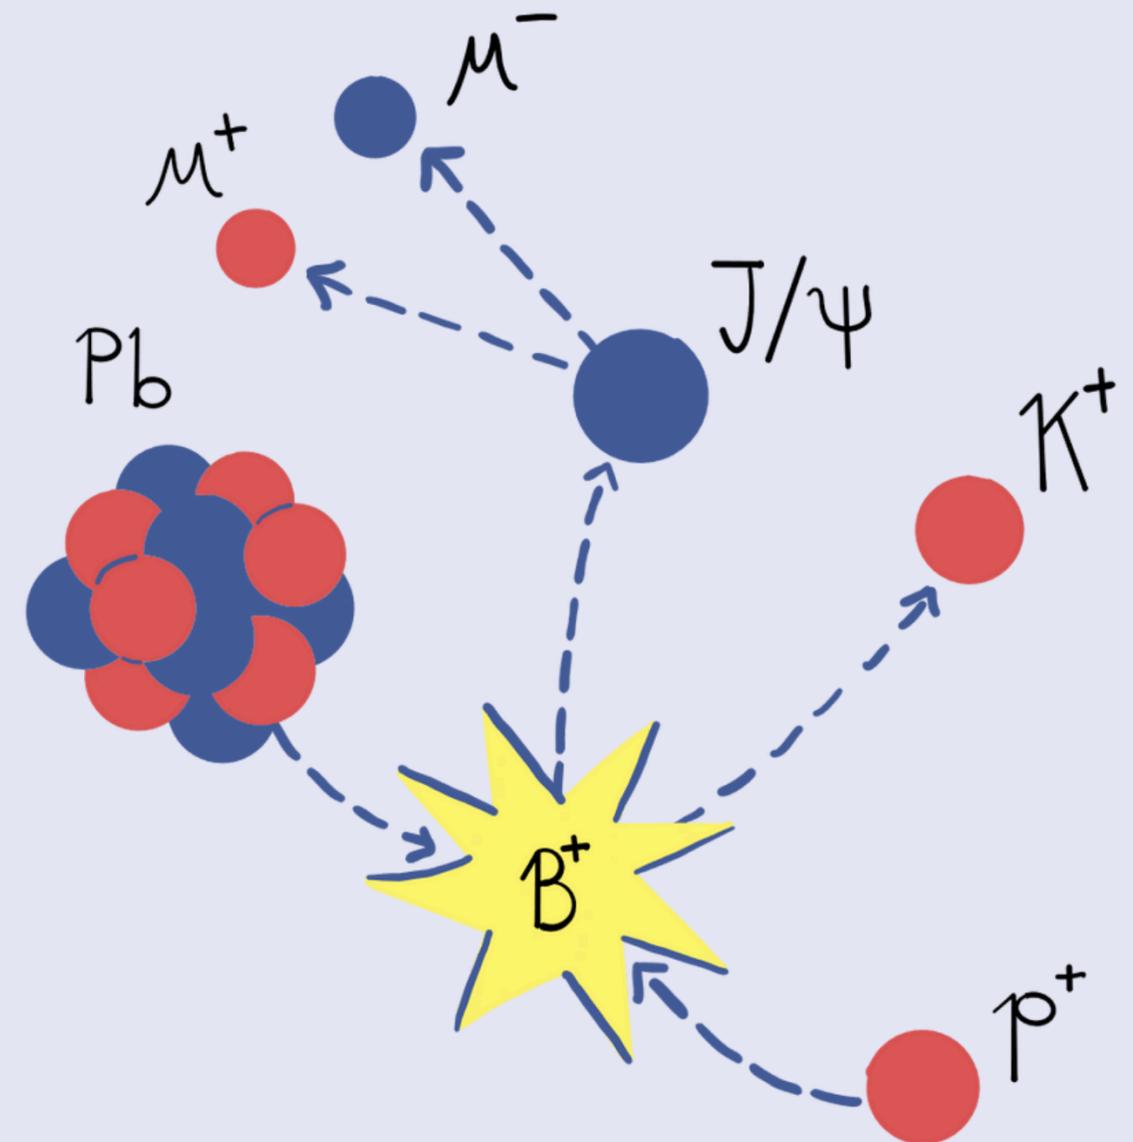

[6] CMS-PAS-HIN-22-001

Measurement of the  $B^+$  differential cross section as a function of transverse momentum and multiplicity in pPb collisions at 8.16 TeV

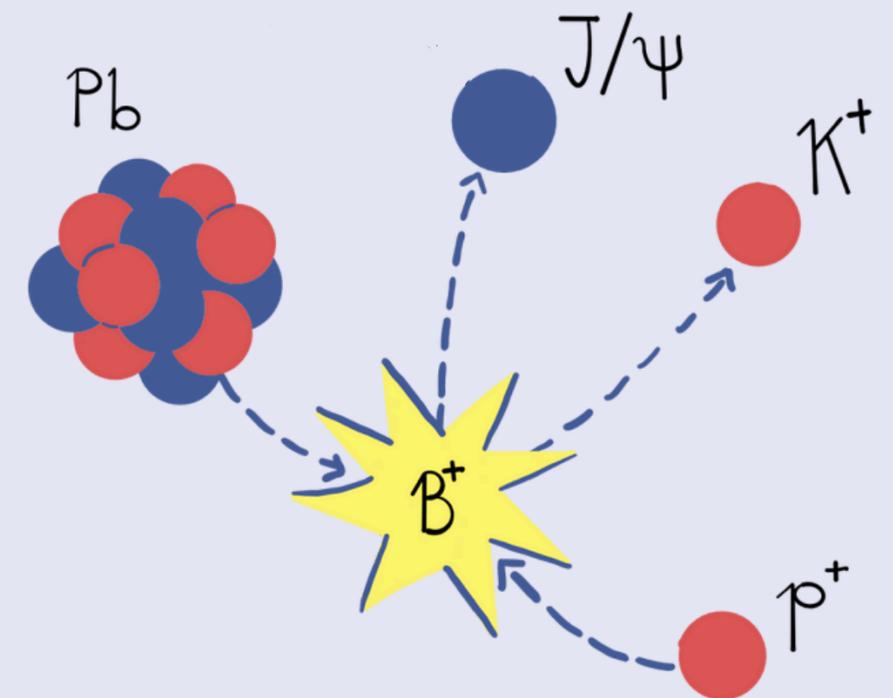

[6] CMS-PAS-HIN-22-001

Measurement of the  $B^+$  differential cross section as a function of transverse momentum and multiplicity in pPb collisions at 8.16 TeV

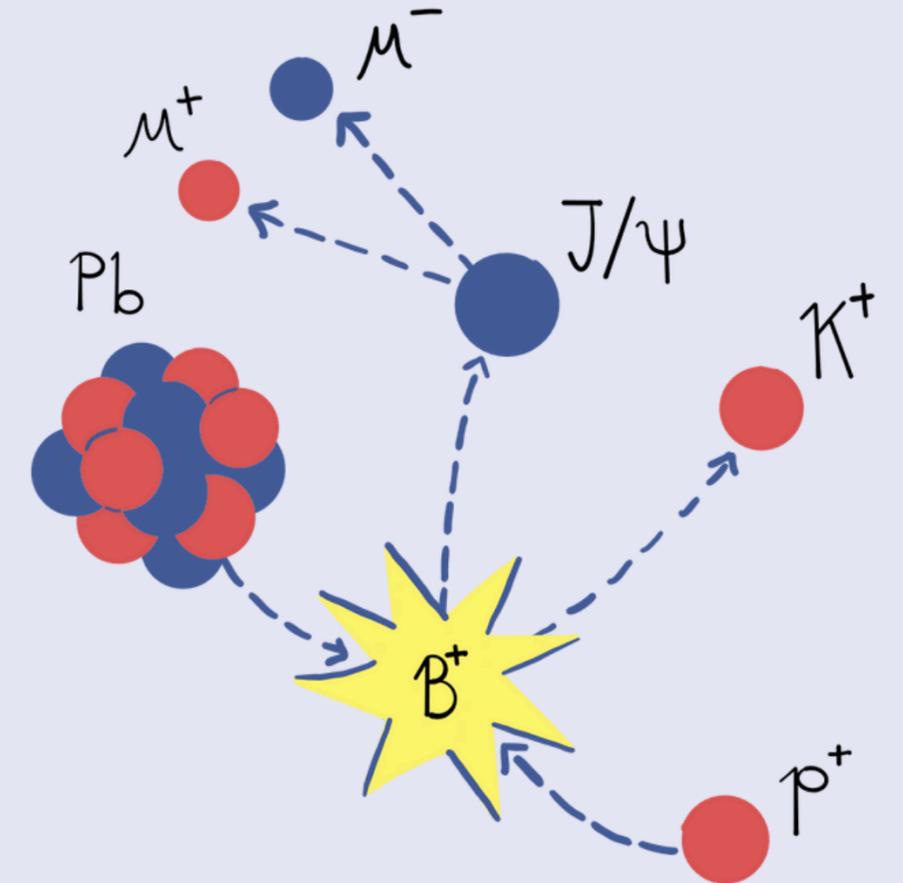

Recent observations of QGP-like phenomena in small collision systems, such as pp and pPb collisions, challenge our understanding of high-energy heavy ion physics.

$$B^+ \rightarrow J/\psi K^+$$

$$B^+ \rightarrow J/\psi K^+$$
$$J/\psi \rightarrow \mu^+ \mu^-$$

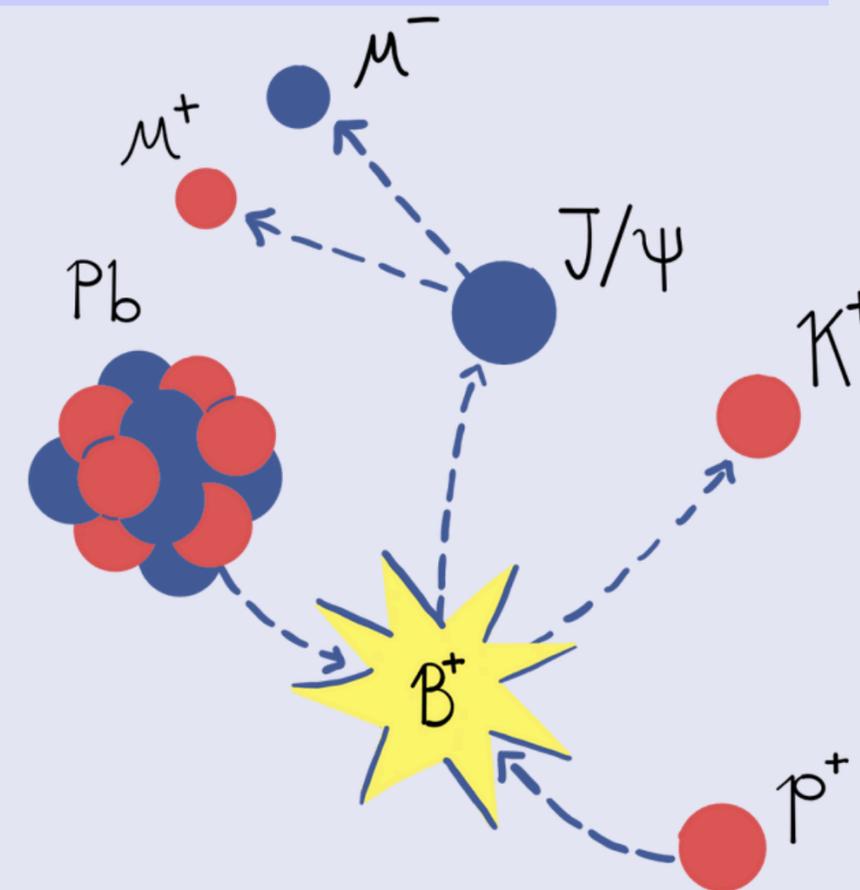

## J/ $\psi$ selection details:

- Prob(vtx) > 0.01 (1%)
- $2.9 < \text{Mass}(J/\psi) < 3.3 \text{ GeV}$
- $p_T(\mu) > 2.0 \text{ GeV}, |\eta(\mu)| < 2.4$
- Soft Muon ID

$$B^+ \rightarrow J/\psi K^+$$

$$J/\psi \rightarrow \mu^+ \mu^-$$

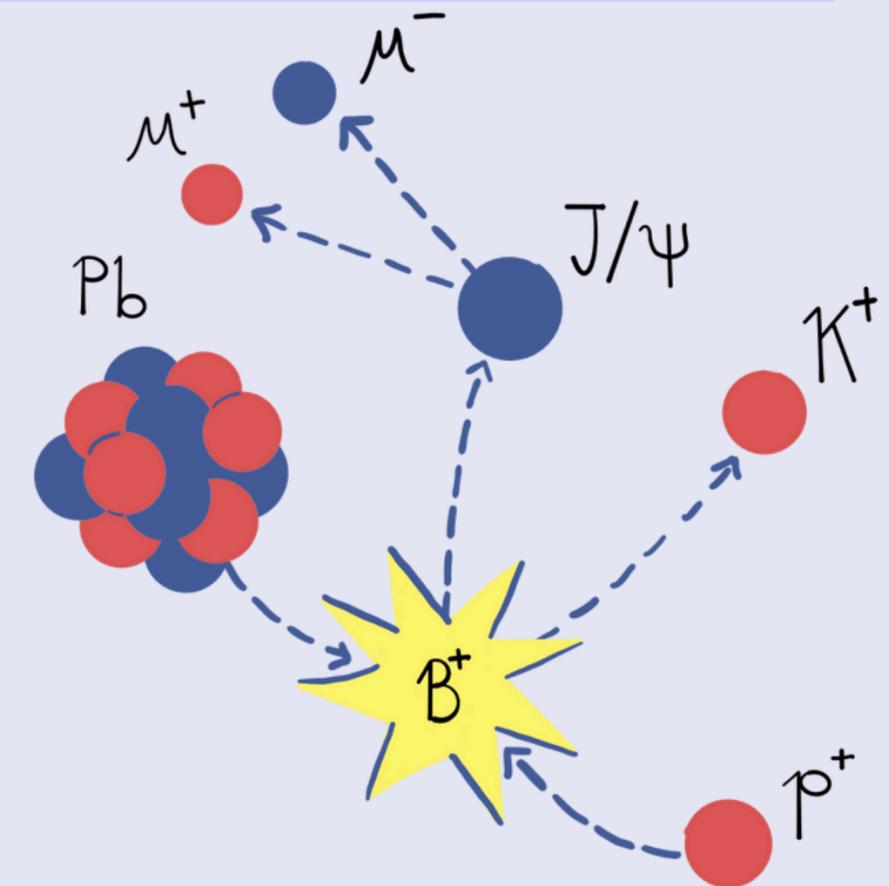

## J/ψ selection details:

- Prob(vtx) > 0.01 (1%)
- $2.9 < \text{Mass}(J/\psi) < 3.3 \text{ GeV}$
- $p_T(\mu) > 2.0 \text{ GeV}, |\eta(\mu)| < 2.4$
- Soft Muon ID

## Datasets

- /PADoubleMuon/PARun2016A-PromptReco-v1/AOD
- /PADoubleMuon/PARun2016B-PromptReco-v1/AOD
- /PADoubleMuon/PARun2016C-PromptReco-v1/AOD
- /PADoubleMuon/PARun2016D-PromptReco-v1/AOD

$$B^+ \rightarrow J/\psi K^+$$
$$J/\psi \rightarrow \mu^+ \mu^-$$

## Trigger

- [HLT PAL1DoubleMuOpen v1](#)

## Trigger

- [HLT PAL1DoubleMuOpen v1](#)

## Trigger details:

- $|\text{Max } \eta| < 2.4$
- $\text{min } p_T = 0.0$

## Trigger

- [HLT PAL1DoubleMuOpen v1](#)

## Trigger details:

- $|\text{Max } \eta| < 2.4$
- $\text{min } p_T = 0.0$
- This trigger requires two muon candidates found in the muon detectors at level-1 (L1) trigger with loosest possible selections to maximize the detection efficiency. During 2016 pPb run, this trigger was operated without any pre-scale.

## Trigger

First B+ meson studies at different charged particle multiplicities in pPb collisions.

- B<sup>+</sup> yields are obtained by unbinned maximum likelihood.
- Signal modeled by: double-gaussian; background by: error function and exponential.
- Results are obtained for 6 p<sub>T</sub> bins and 4 multiplicity classes.

- B<sup>+</sup> yields are obtained by unbinned maximum likelihood.
- Signal modeled by: double-gaussian; background by: error function and exponential.
- Results are obtained for 6 pT bins and 4 multiplicity classes.

## Monte Carlo

- MC samples with PYTHIA, EVTGEN, PHOTOS, EPOS and GEANT 4.
- Correction with tag and probe scale factors derived from efficiency ratio between the data and the MC in  $J/\psi$  analysis for each muon (RECO).
- Slightly discrepancies between data and MC in kinematic distributions. Corrected with reweighting (RECO).

## Monte Carlo

- MC samples with PYTHIA, EVTGEN, PHOTOS, EPOS and GEANT 4.

- Slightly discrepancies between data and MC in kinematic distributions. Corrected with reweighting (RECO).

## Total Efficiency

$$\epsilon = A \times \epsilon_R$$

## Acceptance $A$

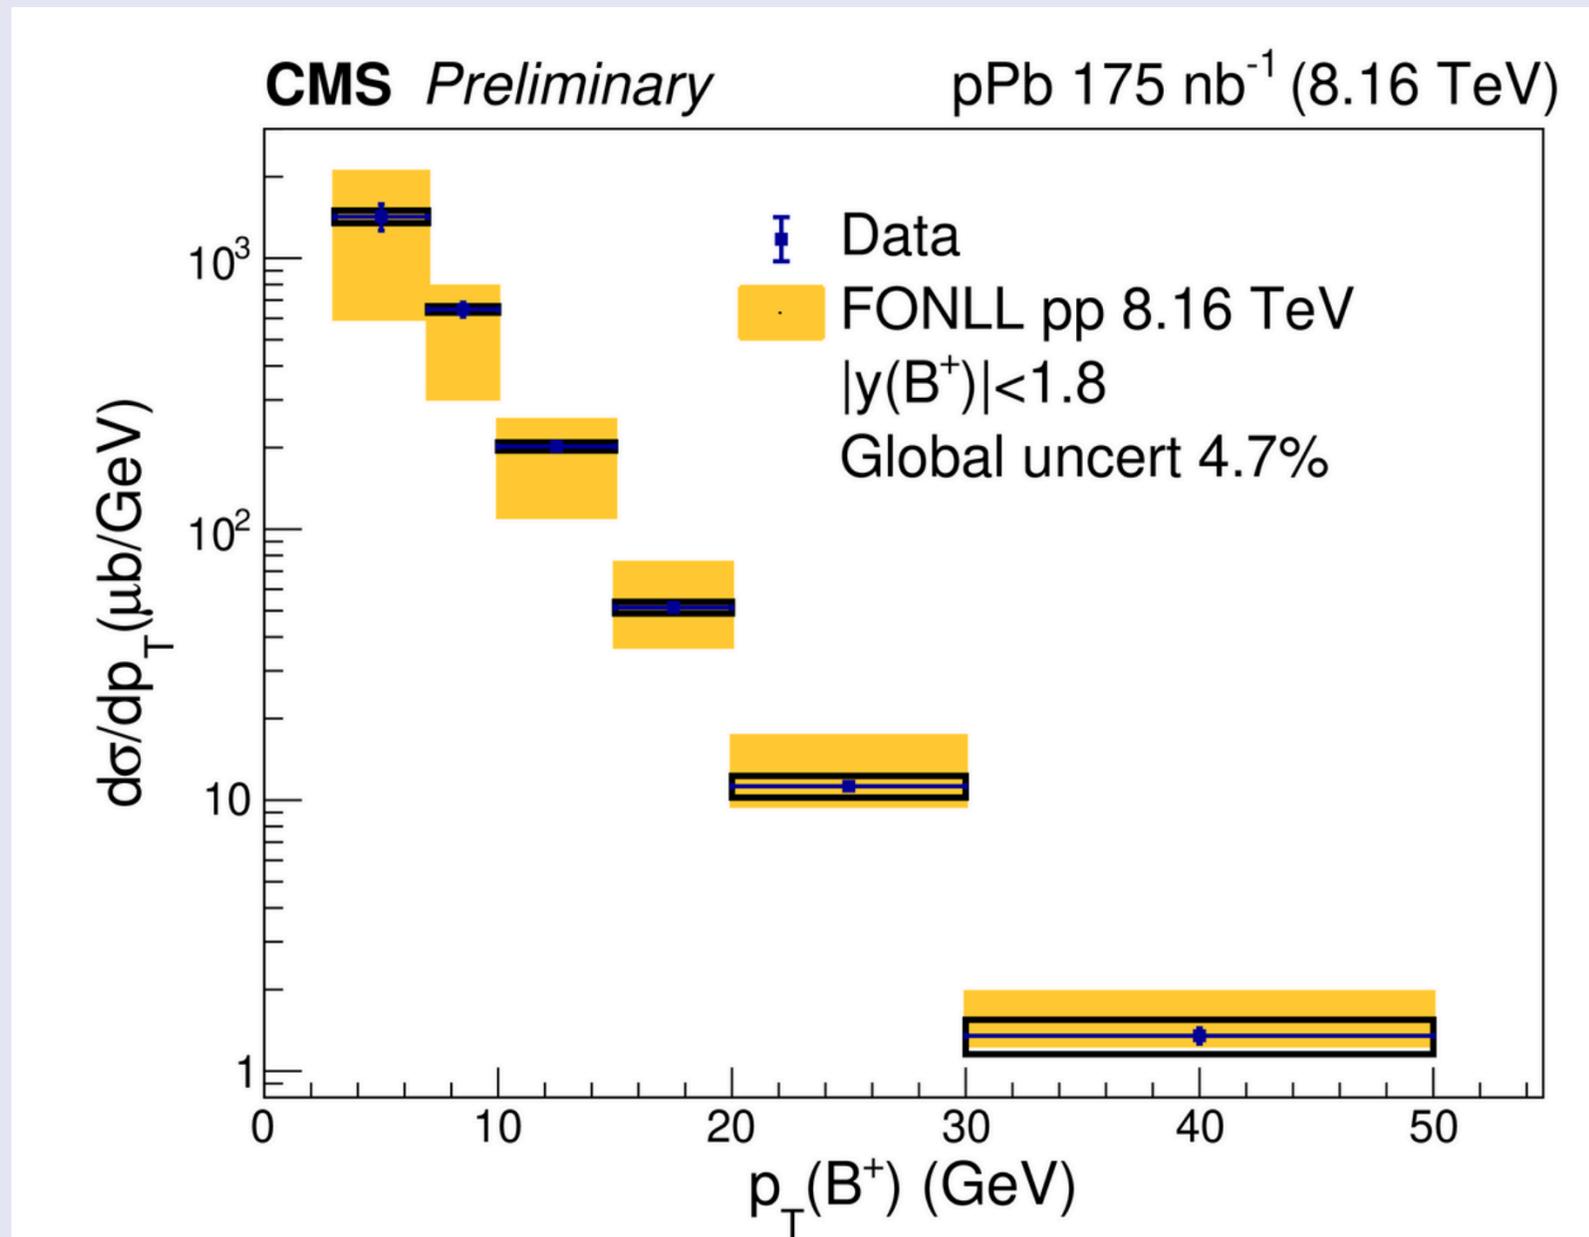

Number of events passing the so called pre-filtercuts is divided by the number of events generated.

## Reconstruction Efficiency $\epsilon_R$

Number of reconstructed events after the full selection divided with respect to the number of generated b decays.

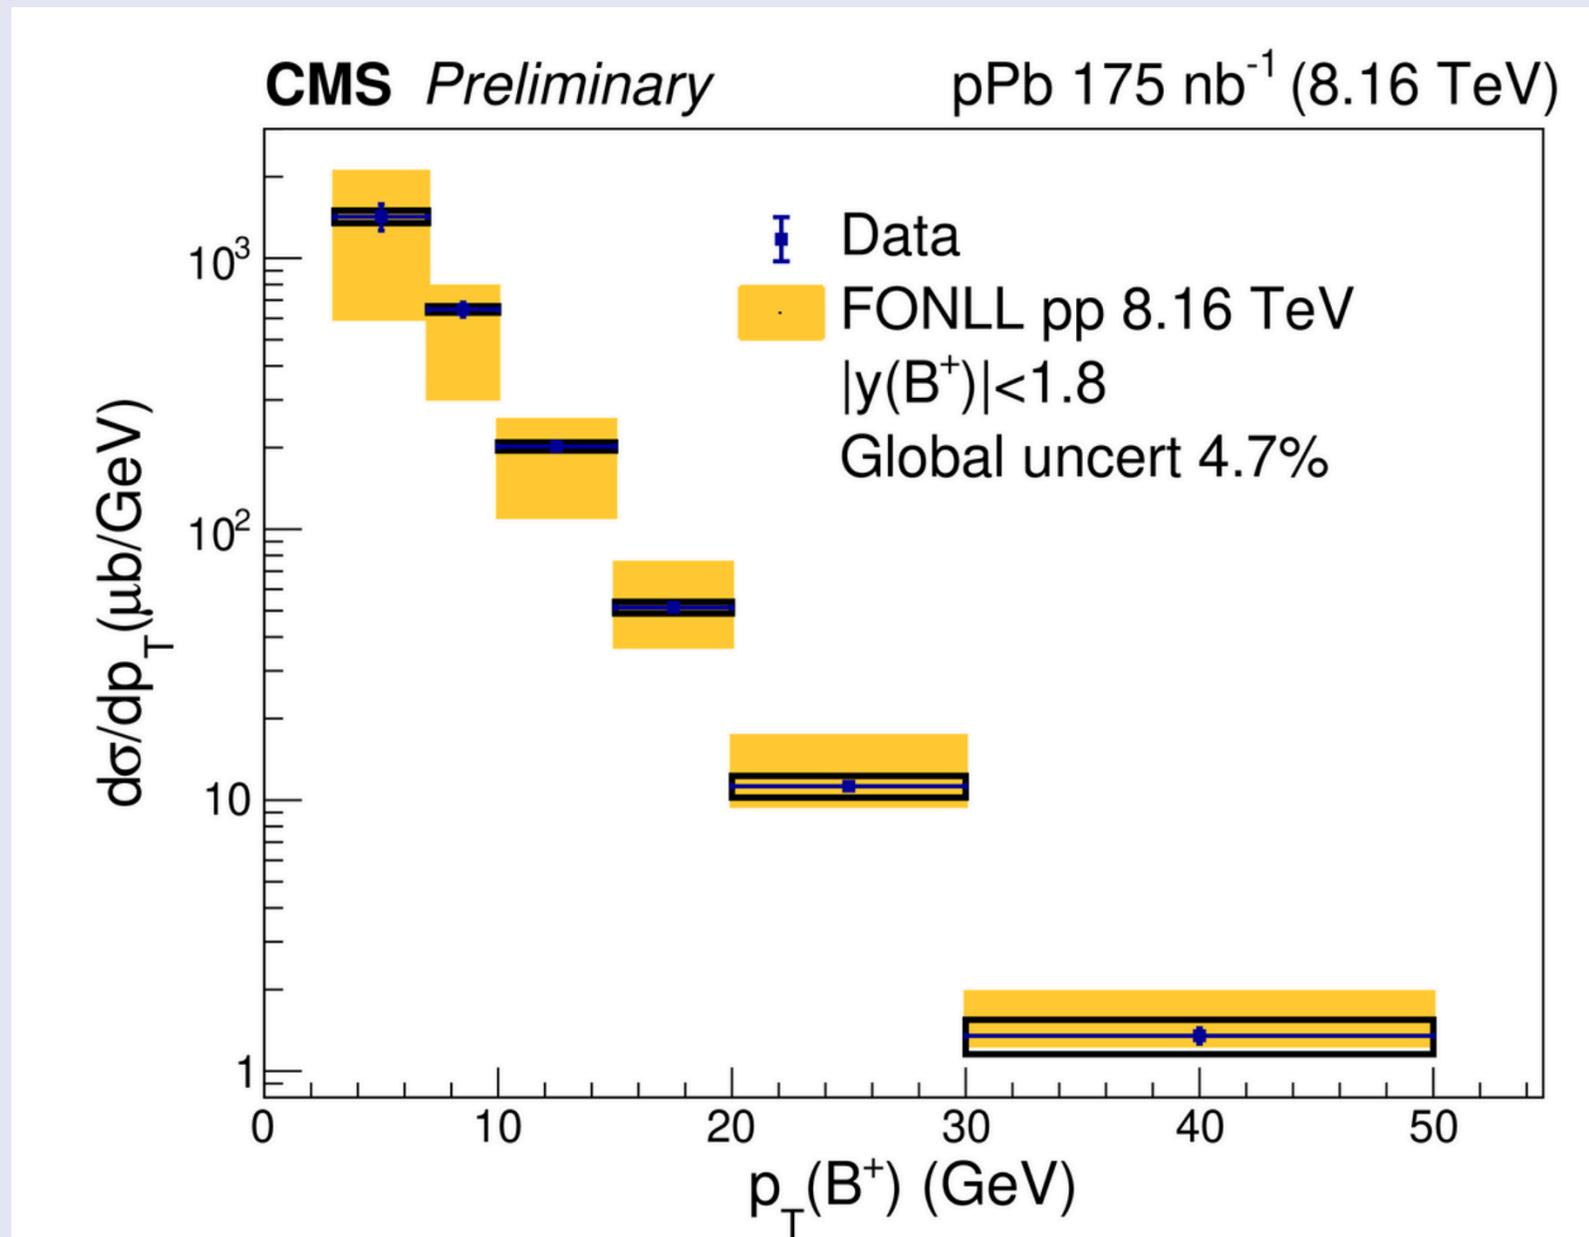

$$\frac{d\sigma}{dp_T} = \frac{1}{2} \frac{1}{\Delta p_T} \frac{N(p_T)}{\epsilon \mathcal{B} \mathcal{L}}$$

- $N(p_T)$  is the measured yield.
- $\mathcal{B}$  product world-average branching fractions.
- $\epsilon$  is the total efficiency.
- $\mathcal{L}$  is the integrated luminosity.

$$\frac{d\sigma}{dp_T} = \frac{1}{2} \frac{1}{\Delta p_T} \frac{N(p_T)}{\epsilon \mathcal{B} \mathcal{L}}$$

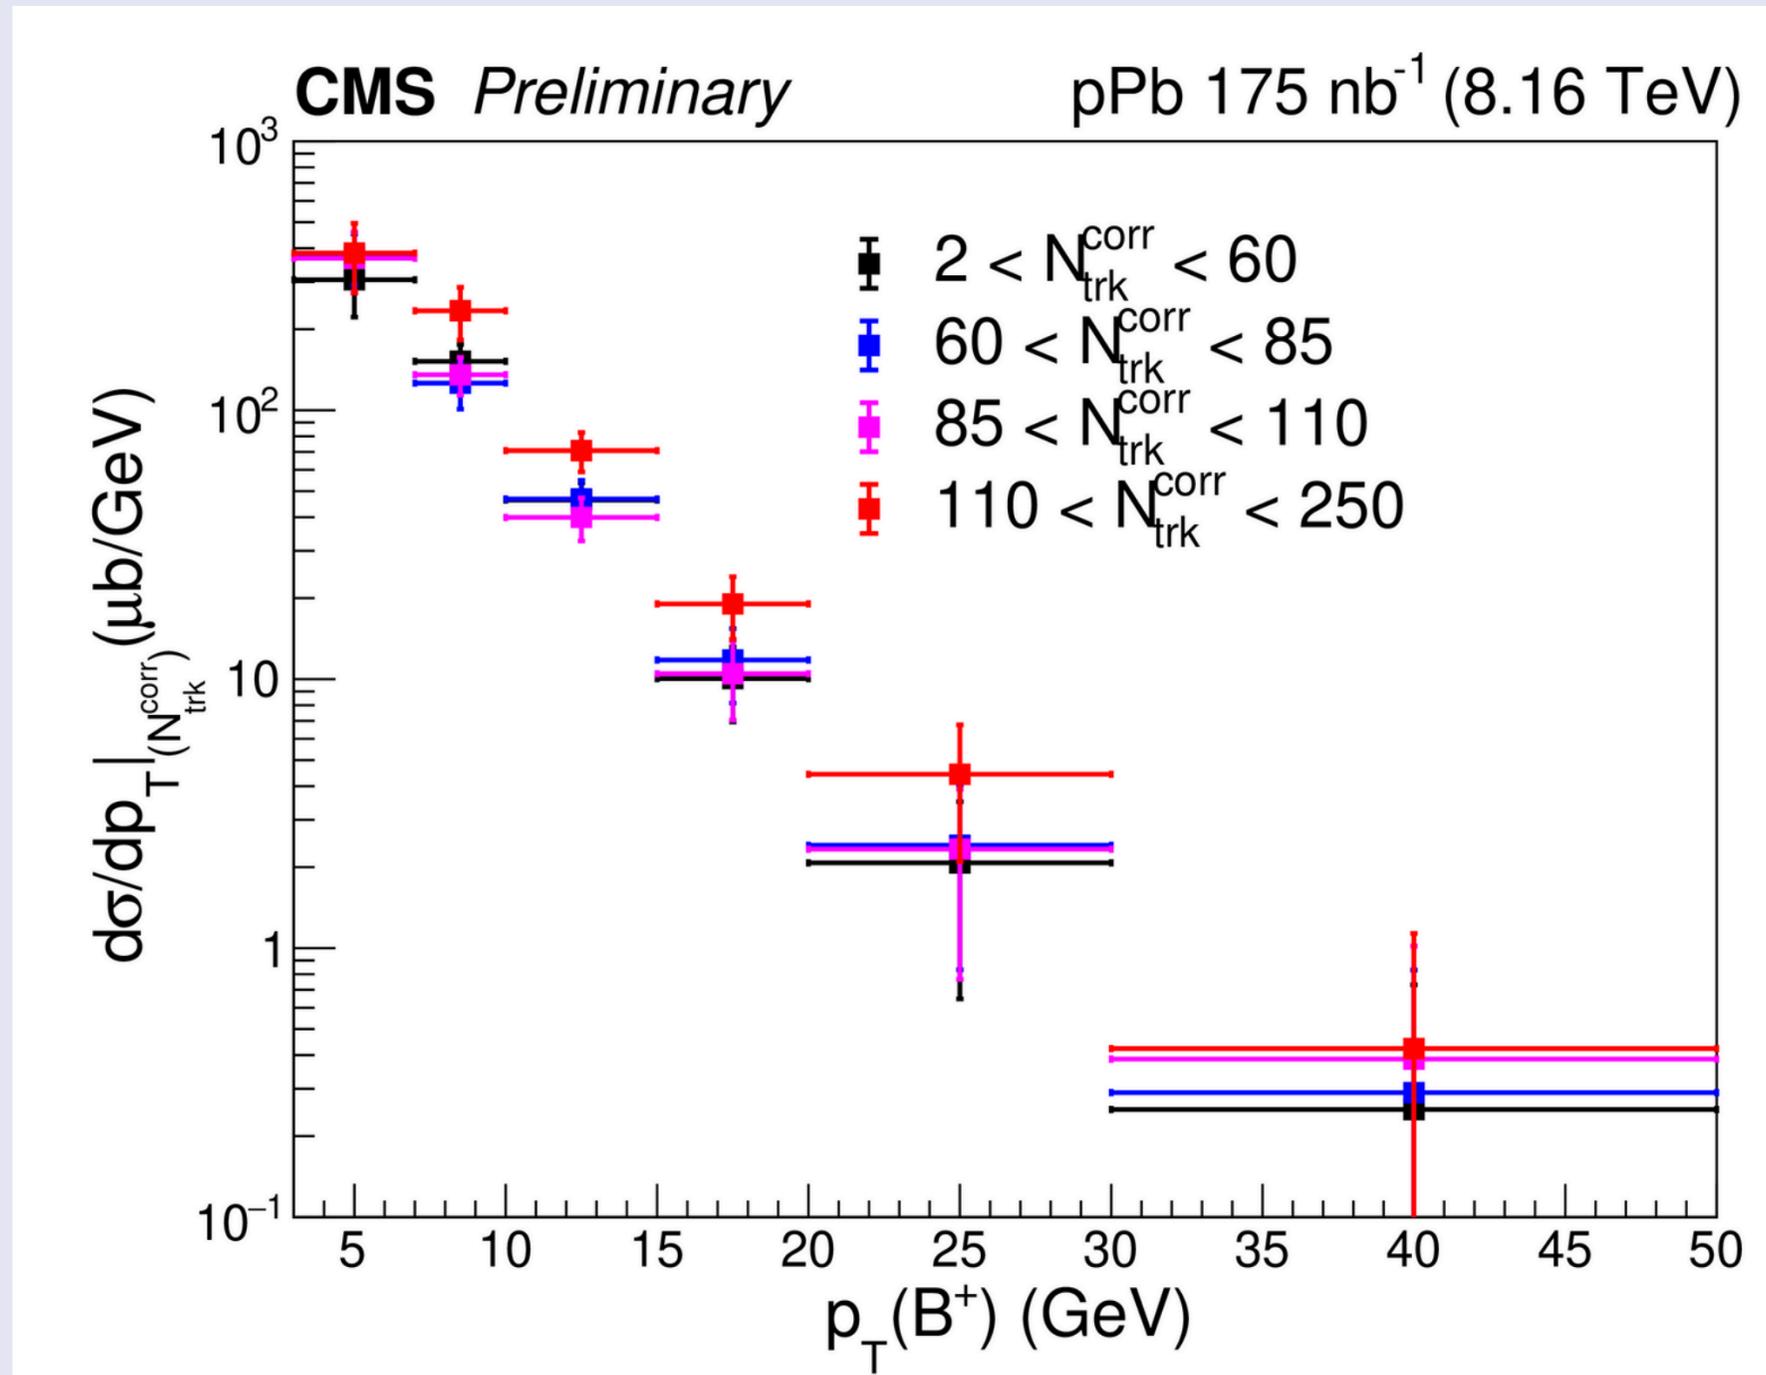

- $N(p_T)$  is the measured yield.
- $\mathcal{B}$  product world-average branching fractions.
- $\epsilon$  is the total efficiency.
- $\mathcal{L}$  is the integrated luminosity.

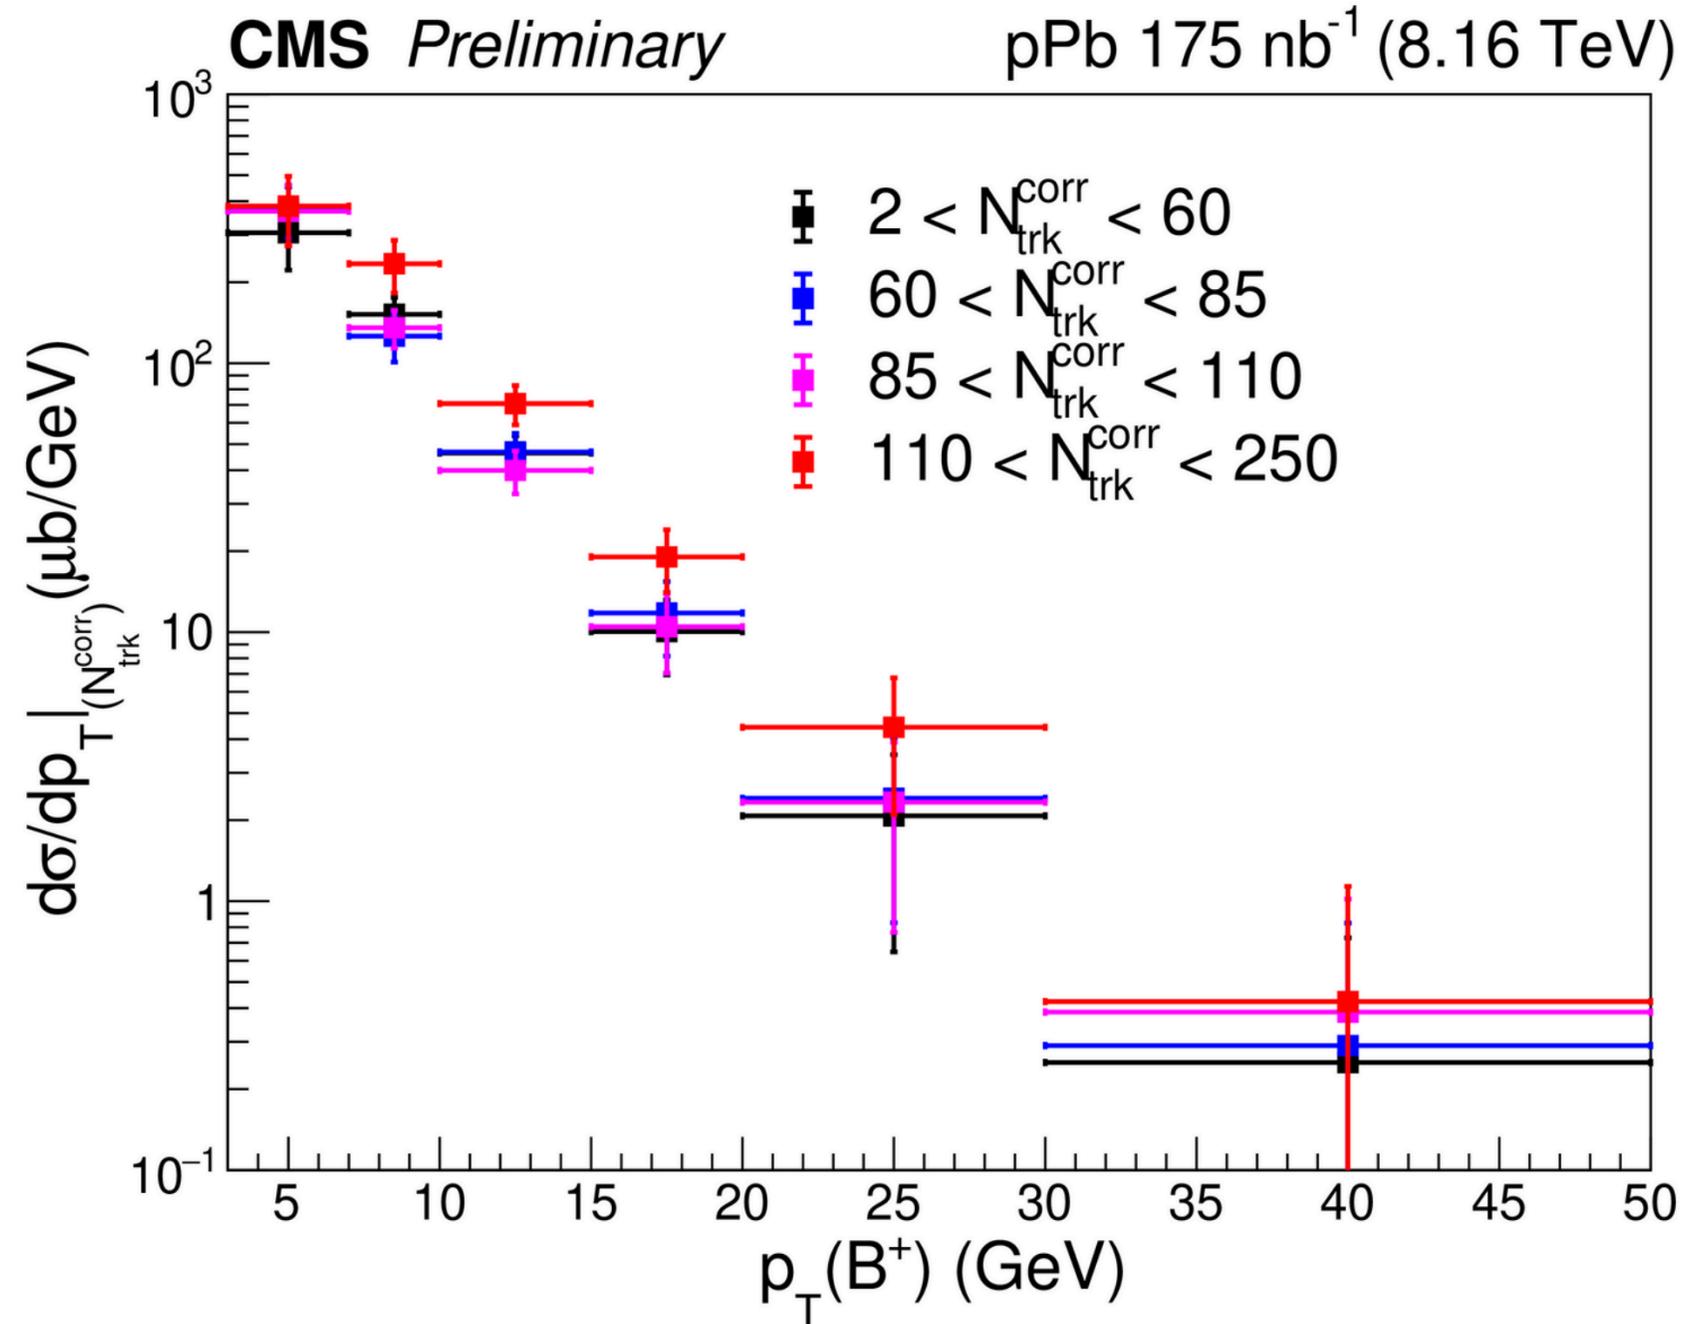

$$\frac{d\sigma}{dp_T} = \frac{1}{2} \frac{1}{\Delta p_T} \frac{N(p_T)}{\epsilon \mathcal{B} \mathcal{L}}$$

- $N(p_T)$  is the measured yield.
- $\mathcal{B}$  product world-average branching fractions.
- $\epsilon$  is the total efficiency.
- $\mathcal{L}$  is the integrated luminosity.

The theoretical predictions of FONLL are in good agreement with the measurements

- Cross section vs. multiplicity.
- Total uncertainties are shown.

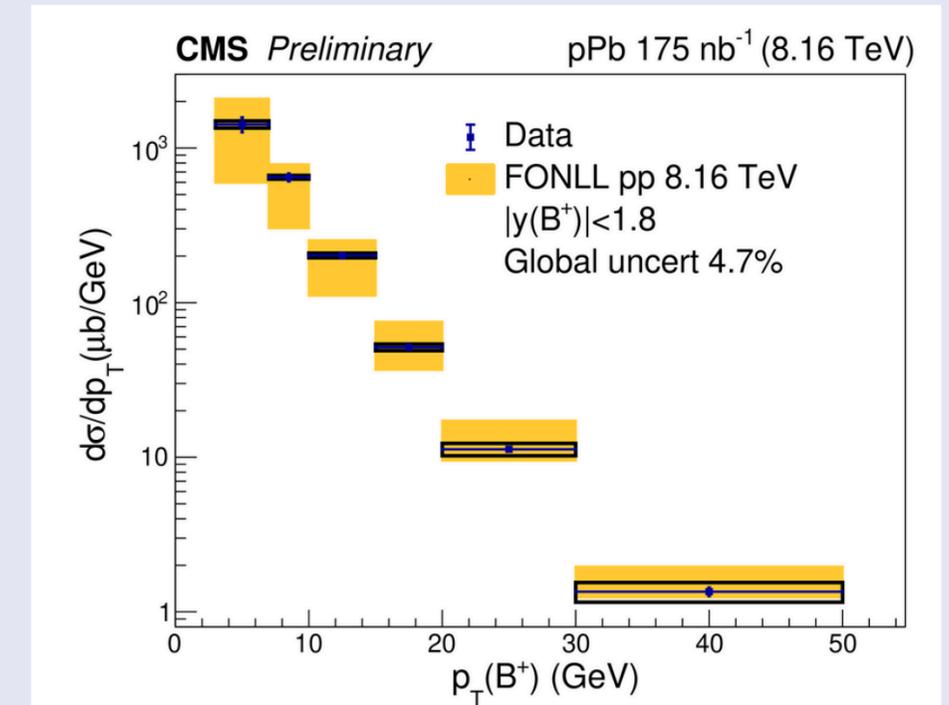

- Cross section vs. multiplicity.
- Total uncertainties are shown.

For the first time in pPb collisions.

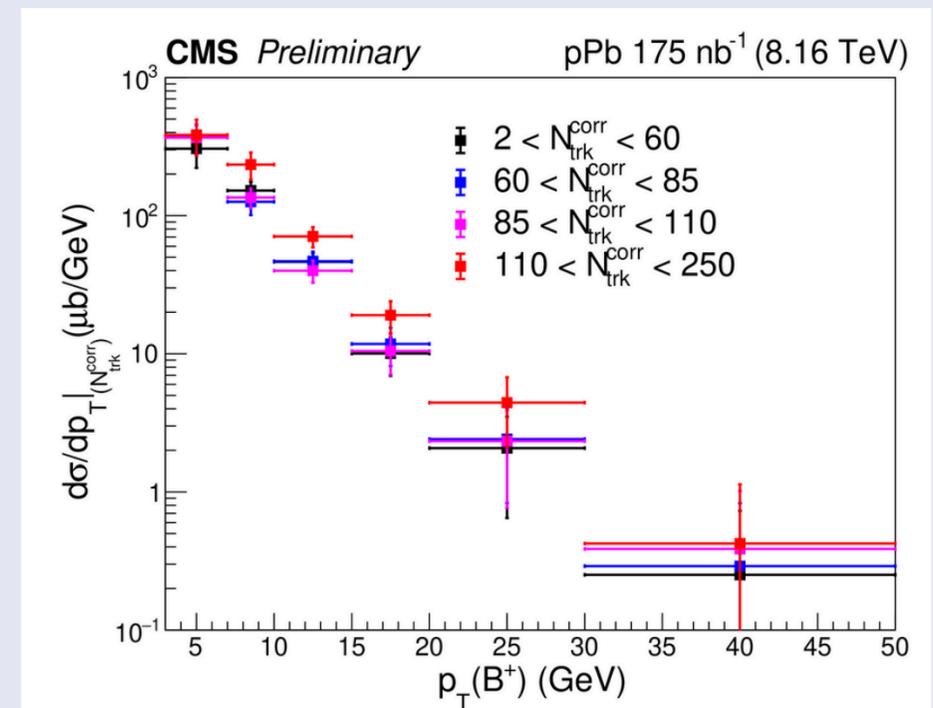

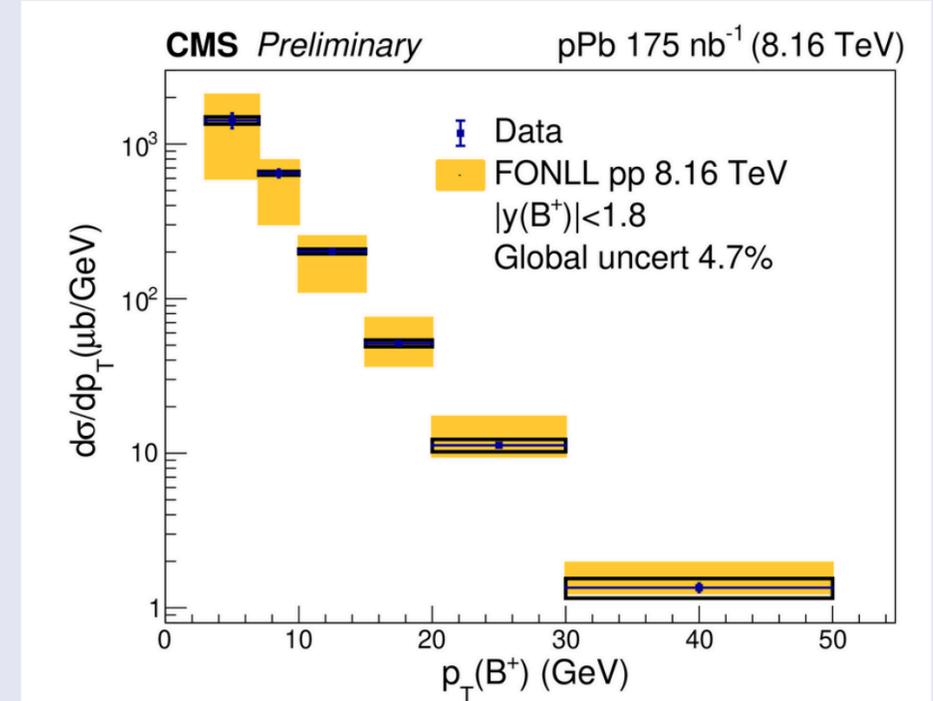

## Conclusions

- B<sup>+</sup> differential cross section measurement is in good agreement with the theoretical predictions.

## Conclusions

- B<sup>+</sup> differential cross section measurement is in good agreement with the theoretical predictions.
- First measurement of B<sup>+</sup> differential cross section in multiplicity classes in pPb collisions.

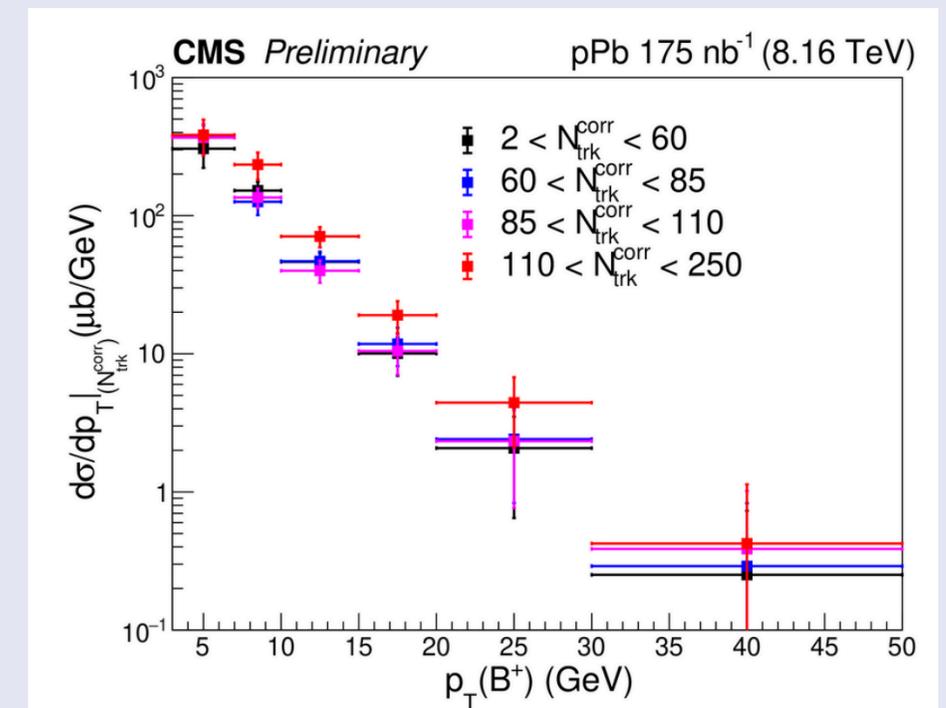

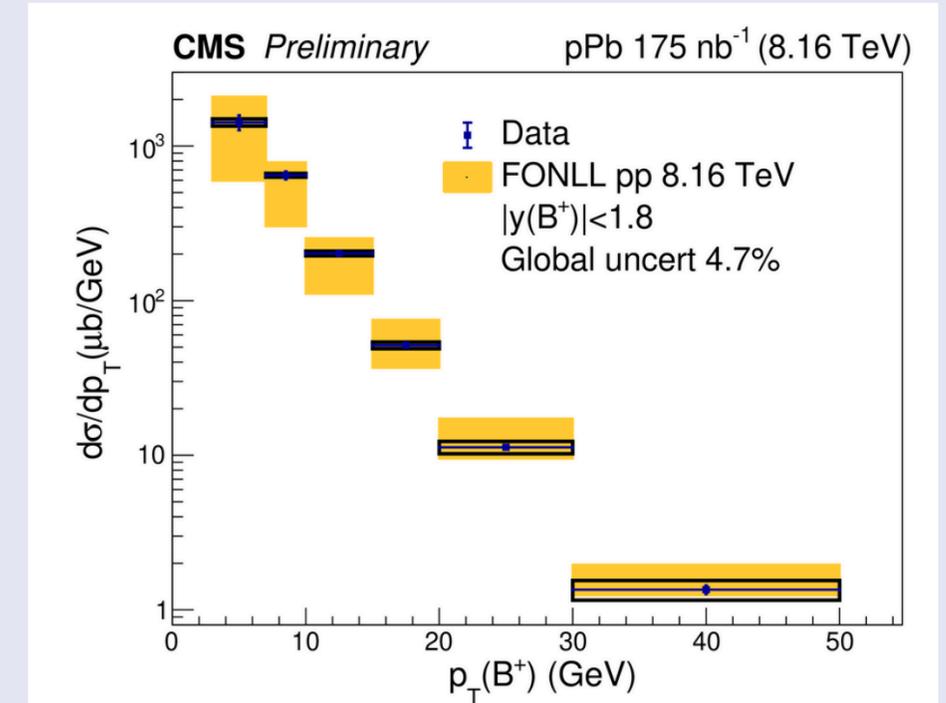

## Conclusions

- B<sup>+</sup> differential cross section measurement is in good agreement with the theoretical predictions.
- First measurement of B<sup>+</sup> differential cross section in multiplicity classes in pPb collisions.

## Next steps

- Studying the suppression via the ratios of Nuclear Modification Factors and multiplicity dependence.

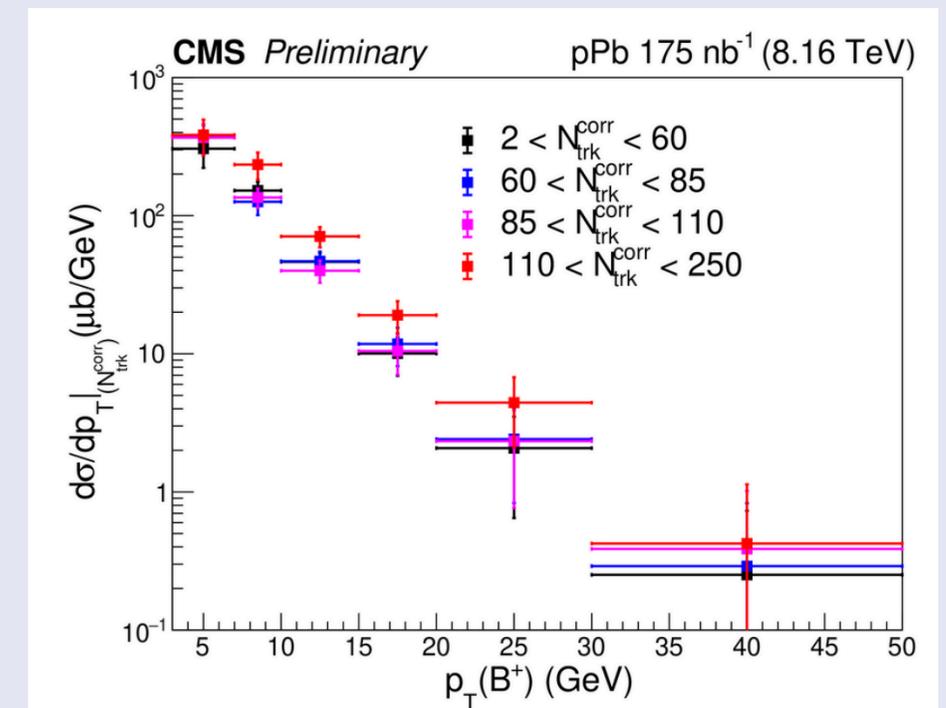

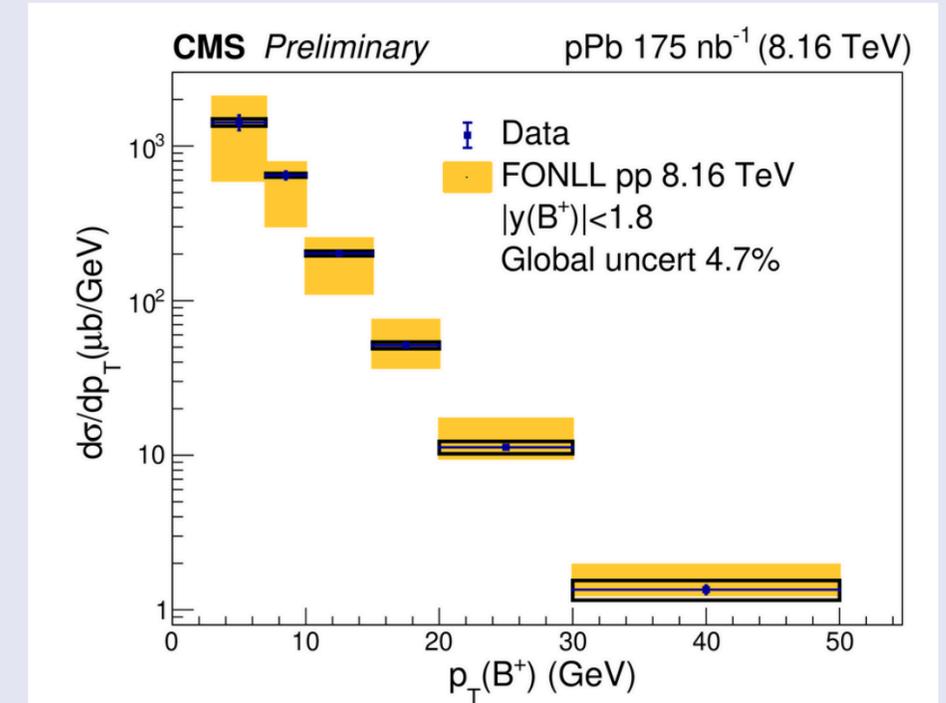

## Conclusions

- B+ differential cross section measurement is in good agreement with the theoretical predictions.
- First measurement of B+ differential cross section in multiplicity classes in pPb collisions.

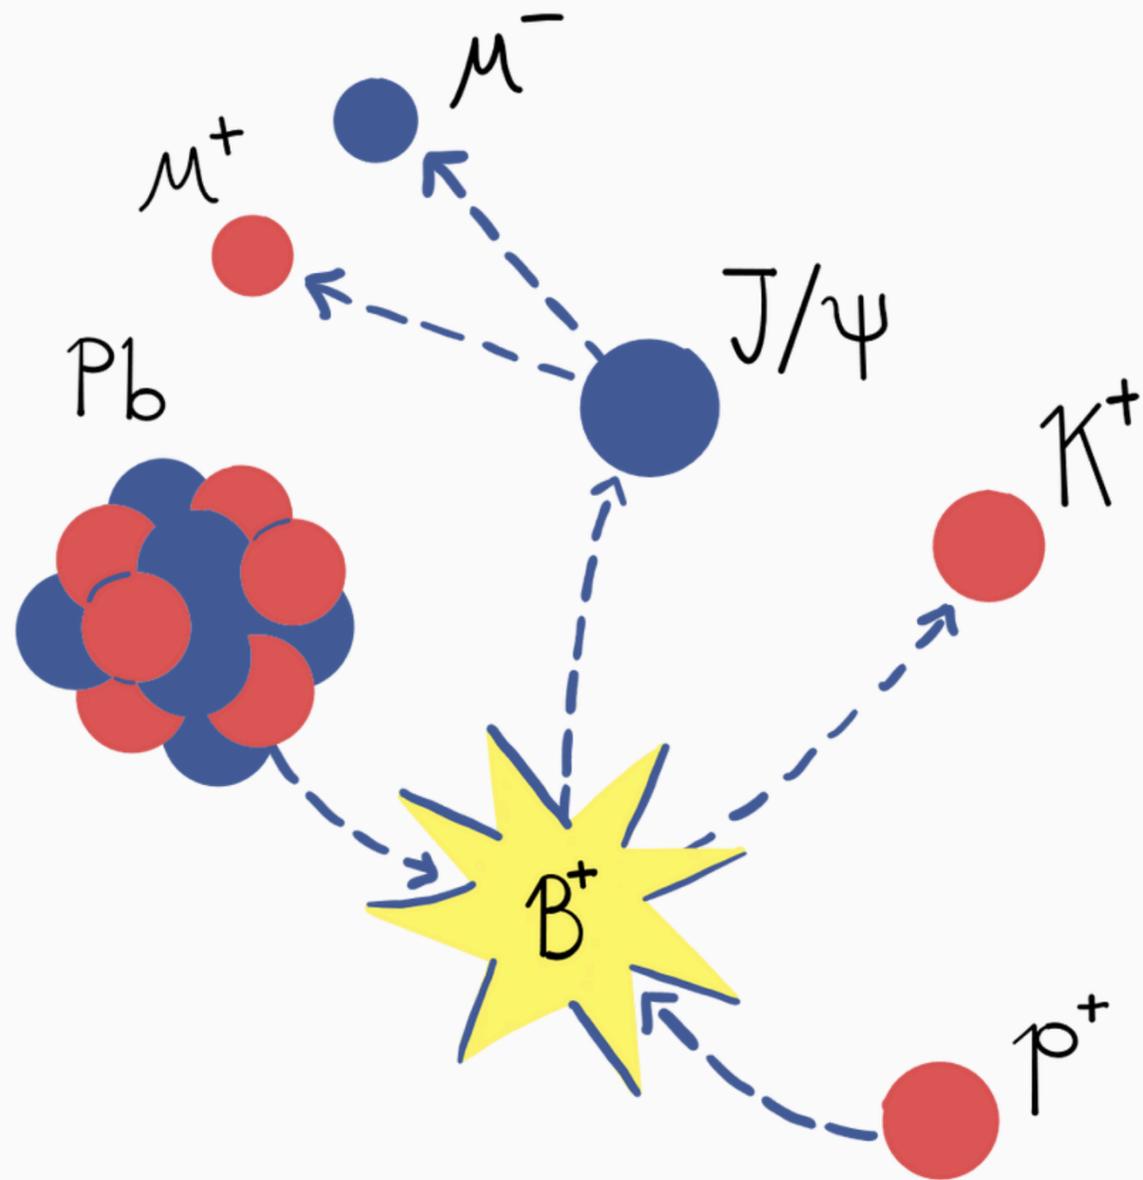

## Next steps

- Studying the suppression via the ratios of Nuclear Modification Factors and multiplicity dependence.
- Publishing the article in next weeks with these results: **We are in the Final Reading!**
