 e-Print: <u>2406.14676</u> [hep-ph]

Seminario Altas Energías ICN - IF

12/03/25

Motivation

- Radiative processes
- Lessons from the W
- Electromagnetic vertex VVy
 - $e^+ e^- \rightarrow \pi^+ \pi^- 2\pi^0$
 - First analysis, the p MDM
- New analysis, what is new?
 - Modeling $e^+ e^- \rightarrow \pi^+ \pi^- 2\pi^0$
 - **Channels and model tests**
 - Magnetic dipole moment from Babar data
 - Conclusions

It carries information on the nature of the particle itself. Related to the spin via the gyromagnetic ratio (g)

The magnetic dipole moment

Spin 1/2

Normal: Dirac 30's

No fundamental states?

Hadron structure and the quark model

Quark model:

Proton, made up of quarks uud Neutron, made up of quarks ddu

Explains the magnitude and relative sign. One of the first successes of the model.

- Spin 1/2 particles, the lighters : u (2/3), d (-1/3), s (-1/3)
 - Baryons (qqq) $\mu_p = \frac{1}{3} (4\mu_u - \mu_d).$ $\mu_{n} = \frac{1}{3} (4\mu_{d} - \mu_{u}).$ gneutrón/gprotón = -2/3 = -0.66

VS. gneutrón/gprotón = -0.6849

Mesons (vector) and their unestable feature

Baryons (qqq)

Example: ρ meson

Spin= 1

 $J^{PC} = 1^{--}$ $Masa = 775.49 \pm 0.34 \text{ MeV}$ Ancho de decaimiento $(\Gamma) = 149.1 \pm 0.8 \text{ MeV}$ Principal modo de decaimiento: $\rho \rightarrow \pi \pi ~(\sim 100 \%)$

S = +1

S = 0

S = -1

Mesons $(q\bar{q})$

 $\tau = \hbar/\Gamma_{\rho}$

5

The extremely short lifetime of vector mesons has prevented the measurement of their magnetic dipole moment (MDM)

Radiative process are an alternative to determine the mdm Radiation emitted off the particle carries information of the electromagnetic structure

 $\rho \rightarrow \pi \pi \gamma$,

 $\tau \rightarrow \nu \rho \gamma$

 $\tau \rightarrow \nu \pi \pi \gamma$

G. Lopez Castro and G. Toledo Sanchez, Phys. Rev. D **56**, 4408(1997); Phys. Rev. D **60**, 053004(1999). G. Lopez Castro and G. Toledo Sanchez, Phys. Rev. D **61**, 033007 (2000).

There is no experimental information on neither of these decays

V. I. Zakharov, L. A. Kondratyuk and L. A. Ponomarev, Sov. J. of Nucl. Phys. 8 456(1969)

FIG. 1. Differential photon spectrum for $\tau \rightarrow \rho \nu \gamma$ decay. See

The extremely short lifetime prevents of applying standard precession techniques

Delphi Col. Eur. Phys. J. C 66 35(2010)

Tests the gauge structure of the standard model. So far it is in agreement with the SM prediction

Lessons from the W

The electromagnetic current is related to the vertex

$$J^{em}_{\mu}(x) = (\rho^{em}(x), \vec{J}^{em}(x))$$

$$(q_2)|J_{\mu}^{em}(0)|V(q_1)\rangle = \eta_{1\nu}\eta_{2\lambda}^*\Gamma_{\mu}^{\nu\lambda}(q_1,k) \equiv J_{\mu}(q_1,k)$$

 $QV = \alpha(0)$ is the electric charge (in e units) $\mu V = \beta(0)$ is the magnetic dipole moment (in e/2MV units) $X_{EV} = 1 - \beta(0) + 2\gamma(0)$ Electric quadrupole (in e/MV² units).

K. Hagiwara, R. D. Peccei, D. Zeppenfeld and K. Hikasa, Nucl. Phys. B282, 253 (1987).

J. F. Nieves and P. B. Pal, Phys. Rev. D 55 3118(1997).

• In QFT the width arises naturally from the absortive part of the loops. •The Ward identity is fulfilled order by order in PT.

G. López Castro y G. Toledo Sánchez, 2000 Phys. Rev. D 61 033007.

Finite width effect on the multipoles is small

Multipole	W boson	ρ meson	K^* meson
Q [e]	1	1	1
$ \vec{\mu} [e/2M_V]$	2.0	2 - 0.0091	2 - 0.0047
$ X_E [e/M_V^2]$	$1 - 4.23 \times 10^{-7}$	1 - 0.0387	1 - 0.097

D. García Gudiño and G. Toledo Sánchez, Phys. Rev. D 81, 073006 (2010).

Unstability

consistent with complex mass scheme

$$D^{\mu\nu}[q,V] = i \left(\frac{-g^{\mu\nu} + \frac{q^{\mu}q^{\nu}}{M_V - iM_V\Gamma}}{q^2 - M_V^2 + iM_V\Gamma} \right)$$

Momentum dependent width

$$\Gamma_{\rho}(q^{2}) = \frac{\left(\sqrt{q^{2}}\right)^{-5} \left(\lambda \left[q^{2}, m_{\pi}^{2}, m_{\pi}^{2}\right]\right)^{3/2}}{m_{\rho}^{-5} \left(\lambda \left[m_{\rho}^{2}, m_{\pi}^{2}, m_{\pi}^{2}\right]\right)^{3/2}} \Gamma_{\rho}$$

Electroproduction of hadrons may be helpful for the rho ? BABAR (SLAC)

Carries the MDM info

Lessons from the W (continued)

Total cross section data from the preliminary analysis of BaBar, we have assigned a 10% systematic error bar (symbols). Provided all the parameters involved in our description are determined from other observables, we performed a fit considering the MDM as the only free parameter.

Model assumptions

Preliminary data

Scarce information on the ρ ' meson

D. García Gudiño and G. Toledo Sánchez, Determination of the magnetic dipole moment of the rho meson using 4 pion electroproduction data, Int. J. Mod. Phys. Conf. Ser. 35, 1460463 (2014), arXiv:1305.6345 [hepph].

D. G. Gudiño and G. T. Sánchez, Determination of the magnetic dipole moment of the rho meson using fourpion electroproduction data, International Journal of Modern Physics A **30**, 1550114 (2015).

The quoted error bar: Uncertainties coming from the couplings of the different channels

Total cross section data from BaBar

Improvements on previous analysis

Uncertainties coming from the couplings of the different channels

Model assumptions

Definite data on this process

Improved information on the p' meson

FIG. 9. The measured dressed $\pi^+\pi^-2\pi^0$ cross section (statis-

FIG. 11. The low-energy part of the vacuum polarization corrected measured undressed cross section (points with statistical uncertainties) compared to the theoretical prediction (line) from Ref. [36].

The channels that we have considered here, include the exchange of the π , ω , a1, σ , f(980), ρ and ρ ' mesons.

$$\mathcal{L} = \sum_{V=\rho, \,\rho', \,\omega} \frac{e \, m_V^2}{g_V} \, V_\mu \, A^\mu + \sum_{V=\rho, \,\rho'} g_{V\pi\pi} \, \epsilon_{abc} \, V^a_\mu \, \pi^b \, \partial^\mu \, \pi^c$$
$$+ \sum_{V=\rho, \,\rho'} g_{\omega V\pi} \, \delta_{ab} \, \epsilon^{\mu\nu\lambda\sigma} \, \partial_\mu \, \omega_\nu \, \partial_\lambda \, V^a_\sigma \, \pi^b \quad + \ g_{3\pi} \, \epsilon_{abc} \, \epsilon^{\mu\nu\lambda\sigma} \, \delta_\mu \, \omega_\nu \, \partial_\lambda \, V^a_\sigma \, \pi^b \quad + \ g_{3\pi} \, \epsilon_{abc} \, \epsilon^{\mu\nu\lambda\sigma} \, \delta_\mu \, \omega_\nu \, \delta_\lambda \, V^a_\sigma \, \pi^b \quad + \ g_{3\pi} \, \epsilon_{abc} \, \epsilon^{\mu\nu\lambda\sigma} \, \delta_\mu \,$$

Modeling $e^+e^- \rightarrow \pi^+\pi^- 2\pi^0$

 $\epsilon^{\mu\nu\lambda\sigma}\,\omega_{\mu}\,\partial_{\nu}\,\pi^{a}\,\partial_{\lambda}\,\pi^{b}\,\partial_{\sigma}\,\pi^{c}.$

Modeling $e^+ e^- \rightarrow \pi^+ \pi^- 2\pi^0$

$$e^+(k_1)e^-(k_2) \to \pi^+(p_1)\pi^0(p_2)\pi^-(p_3)\pi^0(p_4)$$

$$\mathcal{M} = \frac{-ie}{(k_1 + k_2)^2} l^{\mu} h_{\mu}(p_1, p_2, p_3, p_4)$$

Four pion electromagnetic current current $h_{\mu}(p_1, p_2, p_3, p_4) = -h_{\mu}(p_3, p_2, p_1, p_4)$ $h_{\mu}(p_1, p_2, p_3, p_4) = h_{\mu}(p_1, p_4, p_3, p_2)$

Previous studies C 24 535(2002).

S. I. Eidelman, Z. K. Silagadze and E. A. Kuraev; Phys. Lett. B 346 186(1995); G. Ecker and R. Unterdorfer, Eur. Phys. J. H. Czyz, J. H. Kuhn and A. Wapienik, Phys. Rev. D 77 114005(2008); J. Juran and P. Lichard, Phys. Rev. D 78 017501(2011).

$$h_{\mu}(p_1, p_2, p_3, p_4) = \mathcal{M}_{r\mu}(p_1, p_4)$$
$$- \mathcal{M}_{r\mu}(p_3, p_4)$$

Here: We follow the same approach as in the previous analysis, but now we have explicit gauge invariant amplitudes with Charge conjugation and Bose- symmetry enforced

Leptonic current $l^{\mu} \equiv \bar{v}(k_2)\gamma^{\mu}u(k_1)$

Charge conjugation

+ Gauge invariance

Bose-Symmetry

Written in terms of a reduced amplitude no longer restricted by the symmetries

 $(p_2, p_3, p_4) + \mathcal{M}_{r\mu}(p_1, p_4, p_3, p_2)$ $(p_2, p_1, p_4) - \mathcal{M}_{r\mu}(p_3, p_4, p_1, p_2)$

Similar amplitude for the rho' is added (180^o phase)

In the previous analysis, given the scarce information on the rho', a VMD-like relation was used

$$\mathcal{M}_{A}^{\mu'}(p_{1}, p_{2}, p_{3}, p_{4}) = -e \frac{g_{\rho\pi\pi}^{3}}{g_{\rho}} m_{\rho}^{2} D_{\rho}^{\alpha\mu}[q] (q - 2p_{1})_{\alpha}$$

$$S_{\pi}[q - p_{1}](q - p_{1} + p_{2})_{\gamma} D_{\rho^{-}}^{\eta\gamma}[s_{43}] r_{43\eta},$$

$$\left(\frac{p^{\mu}}{m_V\Gamma_V}\right)$$

 $D_V[p] \equiv 1/(p^2 - m_V^2 + i m_V \Gamma_V)$

$$\frac{m_\pi^2)}{(m_\pi^2)} \bigg]^{3/2}$$

Pseudo-Scalar propagator

$$S_{\pi}[q] = i/(q^2 - m_{\pi}^2).$$

G. Ecker and R. Unterdorfer, Eur. Phys. J. C 24 535(2002).

H. Czyz, J. H. Kuhn and A. Wapienik, Phys. Rev. D 77 114005(2008)

$$\frac{m_{\rho'}^2}{g_{\rho'}}g_{\rho'\pi\pi} = \frac{m_{\rho}^2}{g_{\rho}}g_{\rho\pi\pi}$$

Includes the ppy vertex

The amplitude is:

$$\mathcal{M}_{B}^{\mu}(p_{1}, p_{2}, p_{3}, p_{4}) = -e \frac{g_{\rho\pi\pi}^{3}}{g_{\rho}} m_{\rho}^{2} D_{\rho[q]}^{\alpha\mu}$$
$$r_{12\gamma} D_{\rho^{+}}^{\lambda\gamma}[s_{21}] \Gamma_{\alpha\lambda\delta}^{1} D_{\rho^{-}}^{\eta\delta}[s_{43}] r_{43\eta},$$

Channel B

$$\Gamma^{1}_{\alpha\lambda\delta} = (1+i\gamma)\,\Gamma_{\alpha\lambda\delta}$$

Wherever the ρ meson appears, the ρ ' is also considered

Using a particular set of amplitudes, corresponding to the charge conjugation

The explicit gauge invariant amplitude is:

Channel C

Gauge invariance of channels A, B y C fixes this contribution, applied for every form corresponding to the Bose and C symmetries.

$$q^{\mu}(\mathcal{M}_{rA\mu} + \mathcal{M}_{rB\mu} + \mathcal{M}_{rC\mu}) = 0.$$

$$\mathcal{M}_{ABC_{24}}^{\mu} = \mathcal{M}_{A}^{\mu}(p_{1}, p_{2}, p_{3}, p_{4}) + \mathcal{M}_{A}^{\mu}(p_{3}, p_{4}, p_{1}, p_{2}, p_{3}, p_{4}) \\ + \mathcal{M}_{B}^{\mu}(p_{1}, p_{2}, p_{3}, p_{4}) + \mathcal{M}_{C}^{\mu}(p_{3}, p_{4}, p_{4}, p_{1}, p_{2}, p_{3}, p_{4}) + \mathcal{M}_{C}^{\mu}(p_{3}, p_{4}, p_{4}, p_{1}, p_{2}, p_{3}, p_{4}) + \mathcal{M}_{C}^{\mu}(p_{3}, p_{4}, p_{1}, p_{2}, p_{3}, p_{4}) + \mathcal{M}_{C}^{\mu}(p_{3}, p_{4}, p_{4}, p_{1}, p_{2}, p_{3}, p_{4}) + \mathcal{M}_{C}^{\mu}(p_{3}, p_{4}, p_{4}, p_{1}, p_{2}, p_{3}, p_{4}) + \mathcal{M}_{C}^{\mu}(p_{3}, p_{4}, p_{4$$

Gauge invariant tensor

$$L^{\mu}(a,b) \equiv \frac{a^{\mu}}{a \cdot q} - \frac{b^{\mu}}{b \cdot q}$$

Similar expression is obtained for the neutral pion exchange

Channel D

The explicit gauge invariant amplitude is:

$$p_2, p_3, p_4) = -i e \left(C_d + e^{i\theta} C_d' \right) D_\omega [q - p_2]$$
$$\mathcal{A}[(q - p_2)^2] \epsilon_{\alpha\eta\beta\sigma} \epsilon^{\mu\gamma\chi\sigma} q_\gamma p_{2\chi} p_1^\alpha p_3^\eta p_4^\beta]$$

$$\mathcal{A}[(q-p_2)^2] = 6 g_{3\pi} + 2 g_{\rho\pi\pi} g_{\omega\rho\pi} \left(D_{\rho^0}[s_{13}] + D_{\rho^+}[s_{41}] + D_{\rho^-}[s_{43}] \right) + 2 g_{\rho'\pi\pi} g_{\omega\rho'\pi} \left(D_{\rho'}[s_{13}] + D_{\rho'}[s_{41}] + D_{\rho'}[s_{43}] \right),$$

$$C_d = \frac{g_{\omega\rho\pi}}{g_{\rho}} m_{\rho}^2 D_{\rho}[q], \qquad C'_d = \frac{g_{\omega\rho'\pi}}{g_{\rho'}} m_{\rho'}^2 D_{\rho'}[q].$$

Fit to BaBar data for the ω channel plus a set of observables mentioned above. Improved precision wrt Avalos et al, Phys Rev D 107 056006 (2023), where this channel was a prediction

18

$$\mathcal{L}_{a_1} = 2g_{a_1\rho\pi}(k \cdot q\rho_\mu a_1^\mu - \partial_\nu \rho^\mu \partial_\mu a_1^\nu)$$

N. Isgur, C. Morningstar, and C. Reader, Phys. Rev. D 39 1357(1989)

The explicit gauge invariant amplitude are:

$$\mathcal{M}_{E}^{\mu}(p_{1}, p_{2}, p_{3}, p_{4}) = -i e C_{a} D_{\rho^{-}}[s_{43}] D_{a_{1}}[q - q_{4}]$$
$$F^{\mu\alpha}(q - p_{1}, q) F_{\alpha\beta}(q - p_{1}, q)$$

$$\mathcal{M}_{F_{\sigma}}^{\mu}(p_{1}, p_{2}, p_{3}, p_{4}) = i e C_{\sigma} D_{\sigma}[s_{24}] D_{\rho^{0}}[s_{31}]$$
$$F^{\mu\beta}(s_{31}, q) r_{31\beta},$$

whole region of study and deviations from this assumption are expected to have a very small effect.

Channels E, F and G

$$\mathcal{L}_S = g_{V_1 V_2 S} V_{1\mu} V_2^{\nu} S + g_{SP_1 P_2} SP_1 P_2$$

 $p_1]^{\ -eta}$ $C_a = (g_{a_1\rho\pi}^2 g_{\rho\pi\pi}/g_{\rho}) m_{\rho}^2 D_{\rho}[q]$ $s_{43}),(2$

$$C_{\sigma} = \left(g_{\sigma\pi\pi} \, g_{\rho\rho\sigma} \, g_{\rho\pi\pi}\right)/g_{\rho} \right) m_{\rho}^2 \, D_{\rho}[q]$$

$$F_{\mu\alpha}(a,b) \equiv a \cdot b \ g_{\mu\alpha} - a_{\mu}b_{\alpha}.$$

The corresponding coupling to ϱ' is taken to be the same. As we will show later, this channel is very suppressed in the

Channels E, F and G

Non-resonant channel

The corresponding coupling to ϱ' is taken to be the same. As we will show later, this channel is very suppressed in the whole region of study For the f(980) we use the same coupling constants. and deviations from this assumption are expected to have a very small effect.

Total cross section e $e \rightarrow \pi \cdot \pi / 2\pi^{\circ}$ in the energy region from threshold to 1.1 GeV, compared to several experimental data.

G

Low energy region dominated by the ω and σ channels (D) and (G). Error (shaded area) dominated by the $\sigma(600)$ parameters. In this region there is no effect due to variations of the parameters on channel (B)

The explicit gauge invariant amplitude is:

 $\mathcal{M}_{G}^{\mu} = i \, e \, (g_{\sigma\pi\pi})^2 \, D_{\sigma}[s_{42}] \, L^{\mu}(x_1, x_3).$

FIG. 11. The low-energy part of the vacuum polarization corrected measured undressed cross section (points with statistical uncertainties) compared to the theoretical prediction (line) from Ref. [36].
