WHO GENERATES THE STRONGEST MAGENTIC FIELDS?

USUAL SUSPECTS

• NEUTRON STARS.

WHATTHEY HAVE IN COMMON?

NOT ONLY MAGENETIC FIELD

T-B or $\mu-B$

SOME OPTIONS

Effective models	Region
Holography	Strong couplings
Hadronic fields	Low Energy, nuclear physics
HLS	Vector mesons
Chiral models	Chiral restoration

CHIRAL MODELS AS LSMQ OR NJL

IMAGINASY MASSES

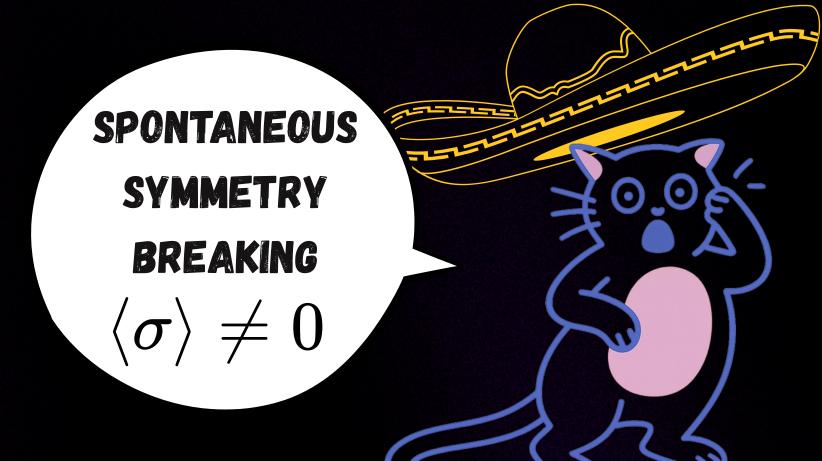

LET BE A SYMETRIC AND PERFECT WORLD.

$$\mathcal{L} = \frac{1}{2} \left[(\partial_{\mu} \sigma)^{2} + (\partial_{\mu} \vec{\pi})^{2} \right] - \frac{\mu^{2}}{2} (\sigma^{2} + \vec{\pi}) - \frac{\lambda}{4} (\sigma^{2} + \vec{\pi}^{2})^{2} + i \bar{\psi} \gamma^{\mu} \partial_{\mu} \psi - i g \bar{\psi} \gamma^{5} \vec{\tau} \cdot \vec{\pi} \psi - g \bar{\psi} \psi \sigma$$

EVERYTHING IS IN THE GROUND STATE. TOO BORING!!

We take $\mu^2 \rightarrow -a^2$ with a² > 0, which gives us the famous -and stylistically questionable-'Mexican hat' potential.

In LSMq

$$m_\pi^2 = \lambda v^2 - a^2$$

$$m_\sigma^2=3\lambda v^2-a^2$$

$$v=\langle\sigma
angle$$

WITH SELFENERGY

Tachyonic mesons? oh no!!

WHY IT WORKS?

COUNTER EXAMPLE:

Pion Condensate

$$m_{\sigma}^{2} = \lambda(3v^{2} + \Delta^{2}) - a^{2},$$

 $m_{\pi}^{2} = \lambda(v^{2} + \Delta^{2}) - a^{2},$
 $m_{ch}^{2} = \lambda(v^{2} + 2\Delta^{2}) - a^{2}.$

Isospin chemical potential

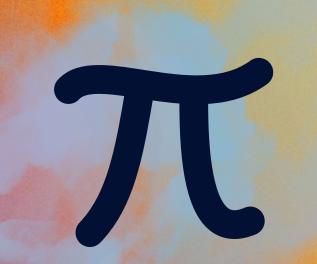

COMPARISON

Selfenergy

Pion cond.

Schwinger proper-time

CONCLUSION

- WE HAVE EXPLORED DIVERSE METHODS TO AVOID THE APPEARANCE OF IMAGINARY MASSES.
- A FUNDAMENTAL OBSERVATION UNIFIES ALL THESE APPROACHES: IT IS CRUCIAL TO ENDOW THE PARTICLES WITH INFORMATION ABOUT THE MEDIUM IN WHICH THEY PROPAGATE.

The tachyon is a ghost in our theoretical machinery, telling us we are expanding around the wrong vacuum. Our job is to listen to it and evolve the vacuum along with the medium.

Thankall
