Observation of ultra high energy cosmic rays with the surface detector array of the TA experiment

Saturday, 7 July 2007 12:17 (0:12)

Abstract content

The Telescope Array (TA) experiment is an array of surface detectors surrounded by three stations of fluorescence telescopes in Utah, USA, to investigate the origin of the highest energy cosmic rays of energy beyond 10^{20} eV. We deployed about 500 plastic scintillation counters on a grid with 1.2 km spacing as a surface array by March 2007. Each surface detector is outfitted with double layer scintillators of 3m^2 area, readout electronics, and wireless LAN communication system, which are powered by solar system. Here we present the performance of the surface detector array and the status and the prospect of observation of air shower events.
