EAS Longitudinal Development and the Knee

Monday, 9 July 2007 11:35 (0:12)

Abstract content

It is shown that EAS longitudinal development has a critical point where an equilibrium between the main hadronic component and the secondary electromagnetic one is broken. This results in a change of slope in quasi-power law function $N_e(E_0)$. The latter leads to a knee in the EAS size spectrum at primary energy of about 100 TeV/nucleon at sea level.
