Search for pulsed multi-TeV gamma rays from the Crab pulsar with the Tibet III air shower array

Friday, 6 July 2007 14:45 (0:00)

Abstract content

We observe the steady emission of multi-TeV gamma rays from the crab nebula from observation of the Tibet air shower array. In this conference, we will also report that no evidence for long-term variability of flux intensity from the Crab Nebula is found. In this article, we will present the result that a search for pulsed multi-TeV gamma rays emission from crab pulsar using data taken with the Tibet III air shower array.
