Gamma/hadron separation in IACTs using 3D EAS variables

Monday, 9 July 2007 14:45 (0:00)

Abstract content

Charged Cosmic Rays are a huge background in any IACT measurement. Traditional data analysis methods involve variables that try to characterize the shape of the shower 2D pattern at the IACT focal plane. The Hillas parameters are, in this context, widely used. In this contribution an innovative method based on 3D variables, the angles and the distances (impact parameters) in space between the direction of active pixels and the EAS axis, is presented. A preliminary discussion of the effectiveness of such a method is briefly reported.
