Technical data acquisition equipment for GOSAT

Monday, 9 July 2007 14:45 (0:00)

Abstract content

We have developed the technical data acquisition equipment (TEDA) for Green House Observing Satellite (GOSAT). GOSAT will be launched in middle of 2008 into sun synchronous sub-recurrent orbit with altitude of 666km and inclination of 98deg, and nominal mission duration is 5years.

TEDA is a comprehensive orbital radiation environment monitor system designed to provide measurement of the energy spectra of energetic electron, proton, and heavy ion having mass from helium to iron. TEDA comprises new developed five sensors that are considerably compact, lightweight and improved in the detection performance compared to the conventional sensors for spacecraft.

The obtained data is expected to contribute to science and technology such as understanding the cause of radiation-induced spacecraft degradation and anomalies, updating the space radiation environment model, and so on.
