Interpretation of the muon charge ratio in MINOS

Thursday, 5 July 2007 08:42 (0:12)

Abstract content

MINOS is the first large magnetic detector deep underground and is the first to measure the muon charge ratio with high statistics in the region near 1 TeV. An approximate formula for the muon charge ratio can be expressed in terms of $\epsilon_{\pi} = 115 \text{ GeV}$, $\epsilon_K = 850 \text{ GeV}$ and E_{μ} times cosine theta-zenith. The implications for K production in the atmosphere will be discussed.
