## Latest Results of Air Shower Simulation Programs CORSIKA and CONEX

*Thursday, 5 July 2007 11:18 (0:12)*

### Abstract content

Interpretation of EAS measurements strongly depends on detailed air shower simulations. The uncertainty in the prediction of shower observables for different primary particles and energies is currently dominated by differences between hadronic interaction models. The new models QGSJET-II and EPOS, which reproduce all major results of existing accelerator data (including detailed data of RHIC experiments for EPOS), have been implemented in the air shower simulation programs CORSIKA and CONEX. We will show predictions of these new models and compare them with those from older models such as QGSJET01 or SIBYLL. Results for air shower observables will be discussed in detail.
