Preliminary results of the Moon shadow using the ARGO-YBJ experiment

Friday, 6 July 2007 08:42 (0:12)

Abstract content

ARGO-YBJ is a “full coverage” air shower detector consisting of a carpet of Resistive Plate Chambers, located at Yangbajing (4300m a.s.l.). Using the data collected by the central detector (5800m² area) the cosmic ray shadowing effect due to the Moon is studied. The comparison of experimental results with Montecarlo simulations is also discussed.
