L/E analysis and the limit on decoherence from SK

Saturday, 7 July 2007 12:17 (0:12)

Abstract content

Muon neutrino disappearance probability as a function of neutrino flight length L over neutrino energy E was studied. A dip in the L/E distribution was observed in the data from Super-Kamiokande-I+II, as predicted from the sinusoidal flavor transition probability of neutrino oscillation. The observed L/E distribution constrained $\nu_{\mu} \leftrightarrow \nu_{\tau}$ neutrino oscillation parameters. We also present preliminary results on the constraint on the neutrino decoherence parameter.
