L/E analysis and the limit on decoherence from SK

Saturday, 7 July 2007 12:17 (0:12)

Abstract content

Muon neutrino disappearance probability as a function of neutrino flight lenght L over neutrino energy E was studied. A dip in the L/E distribution was beerved in the data from Super-Kamiokande-I+II, as perdicted from the sinusoidal flavor transition probability of neutrino oscillation. The observed L/E distribution onstrained nu_mu $\langle - \rangle$ nu_tau neutrino oscillation parameters. We also present preliminary results on the constraint on the neutrino decoherence parameter.
