## Search for point-like Dark Matter sources with the GLAST Large Area Telescope

*Tuesday, 10 July 2007 10:54 (0:12)*

### Abstract content

The space satellite GLAST is expected to play a crucial role in indirect Dark Matter searches, thanks both to its ability to perform observations at energy scales comparable to the mass of common dark matter candidates and to its potential of making deep full-sky maps in gamma-rays, thanks to its large field-of-view. Here we will describe the prospects for detecting gamma-rays from point sources of Dark Matter annihilation.
