## IMP 8 GME Particle Observations Over Three Solar Cycles

*Thursday, 5 July 2007 12:53 (0:12)*

### Abstract content

The Goddard Medium Energy experiment on the IMP 8 spacecraft has made nearly continuous observations of the near-Earth energetic particle environment from its launch in October, 1973 until near present. We summarize several aspects of these observations, including solar energetic particle events, CIR-associated events, and cosmic ray modulations. In particular, we note that, as expected from the pattern of smaller recurrent (27 day) cosmic ray modulations seen in the mid 1980's A<0 solar minimum compared to the previous and following (A>0) minima, recurrent modulations are again reduced in the current solar minimum.
