The GLE of December 13, 2006 according to the ground level and balloon observations

Friday, 6 July 2007 10:54 (0:12)

Abstract content

The analysis of the GLE 13.12.2006 using the data of neutron monitors, balloons, and modeling computations has been carried out. The event was connected to the flare and appeared rather unexpected, as it occurred during the ongoing phase of solar minimum. The characteristics of relativistic solar protons were derived by modeling technique from the neutron monitors data. The direct solar proton data obtained by balloons in Apatity and Mirny (Antarctica) allowed to extend the energetic spectra derived from ground based measurements from relativistic to moderate energies (hundreds MeV). The dynamics of solar proton spectra and pitch-angular distributions during the event is investigated.
