Search for coincidences in time and arrival direction of the Auger data with astrophysical transients

Wednesday, 4 July 2007 14:45 (0:00)

Abstract content

The data collected by the Pierre Auger Observatory are analyzed to search for correlations between the arrival directions of high-energy cosmic rays and the positions in the sky of astrophysical transients. Special attention is directed towards gamma-ray observations recorded by NASA's Swift mission, which have an angular resolution similar to that of the Auger surface detectors.
