## Search for Gamma Ray Bursts using the single particle technique at the Pierre Auger Observatory

*Wednesday, 4 July 2007 14:45 (0:00)*

### Abstract content

The Pierre Auger Observatory, with an array of currently more than a thousand Cherenkov detectors filled with 12 m<sup>3</sup> of water, can detect the putative high energy emission of a GRB (photons down to a few hundreds of MeV) by the so-called “single particle technique”, through a coherent increase in the average background particle rates over the whole array, due to secondary particles in the photon-induced showers. We present a search for bursts on data collected since September 2005, as well as a search for excesses in coincidence with bursts observed by satellites.
