The Anisotropy of low energy Cosmic Rays and properties of the local interstellar medium (LISM)

Abstract content

the world's data on the anisotropy of arrival directions of cosmic rays with energies less than and about 10^{14} eV were extracted and its correlation with the properties of various parameters of LISM such as column density of neutral Hydrogen, Brightest stars and relative velocities of the local stars, less than 10 pc from the Sun were studied and some conclusions were drawn.
