Abstract content

The time profiles and energy spectra of 20.01.2005 (class X7.1), 17.01.2005 (class X3.8) and 15.01.2005 (class X2.6) solar flares from NOAA 00720 active region in energy band 0.1-20 MeV by AVS-F data are discussed. The energy spectra of 17.01.2005 and 20.01.2005 solar flares contain nuclear lines, positron line and neutrons capture line. Only positron line and neutron capture line in the spectrum of 15.01.2005 solar flare are detected. Temporal profiles of these flares in energy bands corresponding to observed spectral features are analysed. The thin structure with characteristic timescales 33-92 sec is extracted from flares temporal profiles in energy bands corresponding observed spectral features and confirmed by periodogram analysis (confidence level is 99%).
