Cosmic Ray Positron Fraction Observations during the A- Magnetic Solar Minimum

Monday, 9 July 2007 11:42 (0:12)

Abstract content

As part of our on-going investigation of the charge-sign dependence in solar modulation, we measured the cosmic ray positron abundance ($\sim 1\text{GeV}$) on a long duration balloon flight from Kiruna, Sweden to Victoria Island, Canada during June 2006. Preliminary results from this flight will be presented and compared to previous results.
