

Current and future constraints on neutrinos from large scale structure

Wednesday, 6 June 2012 10:30 (0:45)

Abstract content

Some neutrino properties, such as the absolute mass, can be probed very precisely using cosmological data. In the talk I will review how neutrinos influence the formation of structure as well current bounds on neutrino properties. I will then discuss future structure formation probes, mainly the recently approved ESA mission EUCLID and its potential for probing neutrino physics.
