

ACORDE offline

- Need the logic of the overall offline
- Classes are in some way implemented but no documentation or description
- Digits2rawdata in AliACORDE.cxx under Digits2Raw() Actually this routine seem to load a lot of things are done there
- I am using as reference the T0
- The actual raw data is already implemented in ACORDE ? needed to see if its congruent..
- The calibration is established along some other shuttle routine But again No logic or documented , Is Pedro Gonzalez working in this?
- Some calibdata along a efficiency and access to the OCDB
- Get web page in the offline page, There I will put all the information.
